Dili, May 2023

## Foreword

The Population and Housing Census 2022 is the fourth census to be conducted since independence in 2002 and the first-ever digital census for Timor-Leste. The 2022 census was postponed from 2020 due to the COVID19 outbreak. Previous censuses were conducted in 2015, 2010 and 2004, that is every five years. However, the next census will take place after ten years in line with international recommendations. The 2022 census collected information on population and housing characteristics, as guided by international principles and recommendations. The results will provide disaggregated data for indicators to be used in monitoring the implementation of the Timor-Leste Strategic Development Plan 2011-2030. It will also contribute to measuring progress towards reaching the targets of the globally agreed Sustainable Development Goals.

The results in this report are presented for basic tables and selected indicators, mostly down to municipality level. More census results will be published in the second half of 2023 , followed by in-depth census analyses on various themes.

I would like to express my deepest gratitude to everyone who contributed to the success of the census. The implementation led by the Timor-Leste National Institute of Statistics (INETL) under the Ministry of Finance is outstanding. The technical and financial support provided by UNFPA and others that include UNICEF, WFP, UN Women, UNDP and the Australian Department for Foreign Affairs and Trade through Australian Bureau of Statistics is very much appreciated.

I sincerely sincere hope that these census results and the future publications on basic and thematic analyses will be used widely to evaluate current development programmes and also assist in formulating our future policies and programmes.

## Preface

The Population and Housing Census 2022 was conducted by the Timor-Leste National Institute of Statistics from 5 September to 5 October 2022, using modern technology for data collection in the form of tablets. After the release of the preliminary census results in November 2022, this report on census basic tables is a first in a series of census reports to be released on the basis of the final census results. This volume contains a summary of the census methodology and analysis of main population and housing characteristics. It covers, among other topics, population trends, age and sex composition, migration, household size, marital status, education and labour force characteristics, and access to drinking water and sanitation facilities.

Additional basic tables will be presented in a follow-up census report scheduled to be released in the second half of 2023. In-depth analysis of selected thematic areas will be presented in separate publications. The thematic reports will be on fertility and nuptiality, mortality, migration, population projections, households and housing conditions, labour force and economic activity, disability, youth, gender and a census atlas.

I would like to express my gratitude to everyone who was involved in the census process. First, let me recognise the role of the Vice Minister of Finance, Antonio Freitas, who closely worked with INETL on the census. I would like to extend my special appreciation to the President of INETL, Elias dos Santos Ferreira, for the lead role in directing the census project and chairing the multi-stakeholder Census Technical Committee that brought together stakeholders from the government and development partners.

On behalf of the Ministry of Finance, I would like to especially recognize the contribution of UNFPA in providing technical and financial support, and all other UN agencies, including UNICEF, UNDP, UN Women and WFP. We were pleased to receive support from the Australian Bureau of Statistics during the census process.

Lastly, I would like to recognise the untiring efforts of the staff of INETL throughout the census process up until the release of this report.

## Acknowledgements

The Timor-Leste National Institute of Statistics (INETL), formerly the General Directorate of Statistics, implemented the Population and Housing Census 2022 under the slogan 'Our census, our future be part of it'.

The census was largely financed by the Government of Timor-Leste through the Ministry of Finance. Additional financial and material support in form of tablets and power banks, was provided by UNFPA, UN Women, UNDP, UNICEF and WFP. I would like to express my sincere gratitude for the unwaivering support towards the census.

I would like to acknowledge the invaluable technical support provided by UNFPA throughout the census process. The support provided during field staff training by UN Women is also acknowledged.

Let me also thank a team of independent international monitors from the Australian Bureau of Statistics, who worked with us throughout the enumeration period, their feedback from the field was valuable and timely.

I would like to further express my appreciation to all members of the Census Technical Committee for their advice and guidance in the census. The Census Publication Commission led a successful implementation of the census publicity campaign to ensure that the stakeholders, including the general public, were informed about the census.

Special thanks go to each and every enumerator and supervisor who worked tirelessly, visiting households across the country to collect the census information. They worked for long hours and also at odd hours in trying to collect the information.

Finally, I would like to commend the work of all staff from INETL headquarters and municipality offices, who continue to work for the success of the 2022 census project. I am grateful to the people of Timor-Leste for their cooperation, without which a successful census would not have been possible.

# 1 Introduction and background 

### 1.1 Characteristics and objectives of a census

### 1.1.1 What is a census?

A population census is the largest and most complex statistical operation carried out by a national statistical institute in a country and usually the largest operation carried out in peace time in any country. The United Nations define a population census as 'the total process of planning, collecting, compiling, evaluating, disseminating and analysing demographic, economic and social data at the smallest geographic level pertaining, at a specified time, to all persons in a country or in a well-delimited part of a country' (United Nations, 2017, p. 2). For practical reasons, a population census is often combined with a census of the living quarters in the country. A housing census is defined as 'the total process of planning, collecting, compiling, evaluating, disseminating and analysing statistical data relating to the number and condition of housing units and facilities as available to the households pertaining, at a specified time, to all living quarters and occupants thereof in a country or in a well-delimited part of a country' (ibid).

The population and housing census usually represents a central part of a country's national statistical system, which may include other censuses (for example agricultural and business censuses), surveys and the use of data from administrative registers. Several characteristics distinguish a census from any other survey. The essential features of a census include the following:

- Individual enumeration: information on each person and living quarters is obtained, so that their characteristics can be individually recorded and their various characteristics can be cross-classified.
- Universality: the census provides data on the total number of persons and living quarters within the precisely defined territory of a country.
- Simultaneity: information obtained on persons and living quarters refers to a specific moment in time - the census moment - or a well-defined reference period.
- Regularity: censuses should be conducted at regular intervals, following international recommendations at least every ten years and around years with ' 0 ' as the end-digit.
- Capacity to produce small-area statistics: the census should produce data on the number and characteristics of the population and housing units down to the smallest appropriate geographic or administrative areas of the country, and to small population sub-groups.

### 1.1.2 Why conducting a census?

Evidence-based decision-making is essential for developing efficient and effective policies, planning and monitoring by governments, international organisations, civil society, businesses, academia, researchers and other stakeholders. The information the census provides allows such stakeholders to target their resources more effectively and to plan services and activities for years to come.

The information from a population and housing census on the size, distribution and characteristics of the population and housing units is an indispensable source for describing and assessing people's living conditions and specific economic, social and demographic circumstances. It is also often the only source that can provide information about small areas and small population groups, such as immigrants, people living with a disability or minority groups. This information is required to justify decisions about the distribution and allocation of funds among administrative areas for the provision of education and health
services, social welfare programmes, roads and transportation, water- and power supply, crisis prevention, mitigation and response, the delineation of administrative and electoral boundaries, etc. Similarly, census data can help the private sector in business planning and market analyses.

The population and housing census is required to provide the baseline information to produce a wide range of social and economic indicators, such as literacy-, unemployment-, fertility- and disability rates and the country's gross domestic product. It also provides the base information necessary for calculating many indicators for monitoring the achievement of the Sustainable Development Goals (SDGs) that define the international development agenda up to 2030. The census baseline information is required for making reliable population projections and establishing a sampling frame on which household surveys can be based to produce reliable results. For instance, in-depth surveys about the labour market, health, living conditions and living standards, depend on census information about the size and distribution of the population.

Given the potential of population and housing censuses to contribute to informed decision making, the objectives of the Timor-Leste Population and Housing Census 2022 were the following:

- Produce reliable statistical information on the size, composition, characteristics and spatial distribution of the resident population of Timor-Leste, as well as on the size, characteristics and spatial distribution of the country's housing stock, and more specifically on
- levels of fertility, mortality and migration
- the educational attainment level of the population
- the size and characteristics of the labour force
- the participation of the population in agricultural production
- the prevalence of disability by type
- the rate and patterns of urbanisation
- housing conditions and availability of amenities and assets.
- Produce a sampling frame for household- and housing surveys in the ten years following the 2022 census.
- Produce the baseline for population projections.
- Providing the base for Timor-Leste's Geographical Information System.

### 1.2 The Timor-Leste census over time

Population censuses have been conducted in the territory of Timor-Leste during the Portuguese colonisation. These censuses mainly served administrative and taxation purposes and were not primarily statistical operations. The first comprehensive census was conducted in 1980 during the Indonesian occupation, with an enumerated population of 555 thousand people (see section Error! Reference s ource not found.). The 1990 census helped to set up the political and administrative structures that have been used since the independence of Timor-Leste in 2002. As an independent nation, Timor-Leste conducted three population and housing censuses before the 2022 census, the first in 2004 , followed by those in 2010 and 2015.

All four censuses conducted in independent Timor-Leste applied the traditional census methodology of data collection through field enumeration using paper questionnaires. This implied deploying enumerators, who collected information about individuals, households and housing units directly from respondents and recorded responses in pre-defined questionnaires. In these interviewer-based censuses, enumerators assigned to individually-allocated enumeration areas (EAs) were required to cover all
persons, households and housing units during a specified, short period of time to meet the requirements of universality and simultaneity.

Over time, census methodologies were revised and updated following international recommendations on census taking and lessons learned from previous operations. The main methodological changes implemented in the 2022 Timor-Leste Population and Housing Census were the following:

- Earlier censuses were conducted based on de-facto enumeration, meaning that persons were enumerated in the place where they were present on the census night, regardless of where they usually resided. The 2022 census followed the international trend of moving toward de-jure censuses, in which persons are enumerated in the place where they usually lived on the census night, regardless of where they were on census night. The justification for this shift is related to
- the higher policy and planning relevance of statistics on where people usually stay than where they are at a particular moment;
- the lower risk of omission and duplication of enumerating persons and households;
- respondents have more accurate information about persons who are usual members of the household than on visitors and have better recall of the persons present on census night if these refer to usual household members than to visitors;
- the identification of family nuclei is likely to be more complete.
- Whereas previous censuses used paper questionnaires to record census information, the 2022 census used tablets and digital questionnaires to collect census data. The main advantages of this data collection method are related to higher quality of collected data due to automated routing and builtin checks, shorter interview time, better control of geographical location, time and duration of interviews, almost real-time monitoring of the enumeration progress, faster data processing and more timely dissemination of census results (see section 2.2.3).
- The use of digital EAs maps with pre-defined building locations and colour-coded information on the enumeration status of the building reduces the risks of omitting and duplicating the enumeration of persons, households and housing units (see section 2.2.3).
- New geospatial technologies offered opportunities to integrate geospatial and census data. Each building with a housing unit is geocoded through unique identifiers and geographic coordinates, which allows the aggregation of census data at any teriitorial level, which can be used by the government and development partners, for instance to support planning and service delivery or for disaster preparedness and humanitarian response (see section 2.2.4).

### 1.3 Content and structure of the report

This report provides the first final results of the Timor-Leste Population and Housing Census. ${ }^{1}$ The report is based on a set of 24 basic tables with key information at the national and municipality levels that could be extracted from the census data in the few months since the completion of the enumeration at the end of October 2022. The tables are selected because of their relevance for development planning and reflect the wide range of population and housing topics covered by the census. Apart from the selected basic tables, this report includes general information about the census methodology and operations, and initial analyses of the topics covered in the basic tables produced in this stage.

[^1]Together with the release of the preliminary census results (Government of Timor-Leste, 2022), this report signifies the start of the census dissemination phase. It will be followed by a second - and more extensive - volume with basic tables in the second half of 2023. In addition, a more elaborate administrative report is foreseen, as well as a report on census quality, including the results of the Post Enumeration Survey (PES). A series of in-depth thematic reports will be published, including a report on population projections and a census atlas.

Chapter 2 first provides an introduction to the organisation of the Population and Housing Census 2022 (Section 2.1), the main methodological components applied in the census (Section 0), including the questionnaire development, computer-assisted data capture, use of geographic information technology, census publicity, data processing, census tabulation, as well as the main operations related to the census fieldwork. A separate section is dedicated to limitations of census data that may be required to correctly interpret the census results (Section 2.4). The chapter also provides information about the PES, which was conducted to assess the quality of the census (section 2.5).

Chapter 0 provides the initial analysis of the basic tables included in this report. Subjects that are covered include population composition and trends (Section 233.1), social and health characteristics (section 0), migration (section 0), economic characteristics (Section 3.4), characteristics of households and families (Section 0), and housing characteristics and household amenities (Section 3.6). As a general note, most results on the population presented in Chapter 0 refer to the population in private households and exclude the population living in collective living quarters (around 0.06 percent). Any result that includes the population living in collective living quarters explicitly mentions this in the text or a footnote to the tables and graphs.

Chapter 4 of this report presents the first set of 24 basic tables. Annex II provides concepts and definitions that are required to correctly interpret the data presented in the tables and associated analyses Around 100 census tables are planned. The remaining tables will be published later in 2023. These tables will also include census results at lower administrative levels.

## 2 Census organisation and methodology

### 2.1 Census organisation

### 2.1.1 Institutional setting

By the Statistics Decree Law No. 17/2003, the Timor-Leste National Institute of Statistics (INETL; formerly General Directorate of Statistics - GDS) is the mandated agency to collect statistical data from persons and establishments. The Law No. 1/2015 of 8 July 2015 (Democratic Republic of Timor-Leste, 2015) stipulated that population and housing censuses would be conducted in 2015, 2020 and subsequently with a ten-year interval. This law specified the general objectives of the population and housing censuses ${ }^{2}$, as well as the legal obligation by the respondents to provide correct and sufficient information and clause on the confidentiality of census data.

Due to the COVID-19 pandemic, a new resolution was required to revoke the requirement to conduct the census in 2020. This was stipulated in Resolution No. 14/2022 of 16 March 2022 , which also approved establishing the administrative structure that is responsible for conducting the Population and Housing Census 2022. The resolution specified the responsibilities and composition of the following entities:

- The National Census Commission, which is responsible to provide policy direction and administrative guidance for the census operation, mobilise the necessary human, material and financial resources, approve the technical components necessary for carrying out the 2022 Census, and approve the implementation plan and timetable for the 2022 census. The National Census Commission is composed of selected ministers, heads of UN agencies and leaders of religious organisations, and is chaired by the Hon. Prime Minister.
- The Technical Census Commission, which is responsible for the technical evaluation of census activities, the review of census instruments and recommendations for collecting and processing data. The Technical Census Commission members were chosen from among technical staff of INETL, line ministries and development partners, and is chaired by the President of INETL.
- The Census Publication Commission, which is responsible for informing and preparing the general public for the census operation. The Census Publication Commission comprises staff of INETL and UNFPA working in the field of communication, and is chaired by the National Census Coordinator.
- Coordination Groups at the municipal and administrative post level, which were responsible for support of the census operation at the respective levels.

[^2]The census office established at INETL headquarters operates within this institutional framework and is responsible for implementing all the census activities, as directed by the National Census Commission.

The Timor-Leste state budget financed the largest part of the census operation. UNFPA provided important financial support, as well as a team of international experts for technical assistance. Additional financial or logistic support was provided by UNDP, UNICEF, WFP and UN Women. The Australian Bureau of Statistics engaged a team of census monitors during the enumeration period.

### 2.1.2 Organisational structure

The census office had a well-defined organisational structure (see Figure 2.1) with precise functions and responsibilities. The census management team consisted of permanent staff of the INETL. The head of the census headquarters was the President of INETL, with technical leadership and an overall management role. The National Census Coordinator was responsible for the day-to-day implementation of all census activities. Other senior officers from INETL were assigned the role of regional census coordinators, each in charge of four or more municipalities. There was also a team of field coordinators from census headquarters who also had the role of census master trainer. All the census municipality offices were headed by a municipal census manager who was a permanent staff in charge of the INETL municipal office. An administrator from the municipal office supported the municipality census manager in leading the local census process.

The census central and municipality offices combined had 43 publicity officers responsible for census publicity campaigns. The offices also had 53 staff to execute administrative functions at the census secretariat at the census headquarters and municipal offices. Within the census structure were 50 positions for coders, but due to electronic data collection, only 14 were retained for coding roles. The rest were re-assigned to support administrative functions of the census or to act as reserve staff for census field operations.

For the census fieldwork, INETL relied on a large temporary field staff of 66 administrative post supervisors, 623 census supervisors and 14 municipality census managers. At the bottom of the hierarchy were 2,345 enumerators who conducted the census through house-to-house visits. On average, each census supervisor was assigned four enumerators. Depending on the field situation, the number of enumerators per supervisor was more or less. The supervisors were reporting to the administrative-post coordinators, who nine supervisors.

The census process was supported by a team of international experts. There was one resident Census Liason Officer, whose role was to support the census process. The other international census experts recruited by UNFPA were specialists in geographic information systems and mapping, data processing, census methodology and operations, and quality assurance and PES. The group of experts provided support throughout the census phases of preparation, enumeration, data processing and dissemination.

To monitor the quality of the census fieldwork, a small group of four observers visited the census to monitor and evaluate the operation during fieldwork. The observers were staff members of the Australian Bureau of Statistics and UNFPA.

Figure 2.1: Census organisation structure

### 2.2 Census methodology

### 2.2.1 General methodological features

The Population and Housing Census 2022 was a traditional census in the sense that it consisted of 'actively collecting information from individuals and households on a range of topics at a specified time, accompanied by the compilation, evaluation, analysis and dissemination of demographic, economic and social data pertaining to a country' (United Nations, 2017). For the interviewer-based census, enumerators were assigned to one geo-referenced EA ${ }^{3,4}$ to cover all housing units, households and persons in the EA during the four-week enumeration period of 5 September to 5 October 2022 in order to meet the requirements of universality and simultaneity.

For the census, four units of enumeration were defined:

- Persons refer to all individuals who were usual residents in Timor-Leste on the census moment (midnight of the census night, the night of 4 to 5 September 2022), whether or not they were citizens of the Democratic Republic of Timor-Leste. Exceptions were diplomatic staff and military personnel of foreign countries residing in Timor-Leste, who fall outside the scope of the census and were supposed to be enumerated by their own country of citizenship.
- Households consist of one or more persons with living arrangements according to the 'housekeeping concept'. This refers to arrangements made by persons - individually or in groups - for providing themselves with food and other essentials for living. The following operational census definition of

[^3]a household was used in the census: one or more persons who usually share their dwelling (i.e. housing unit) and share their principal meals.

- Housing units refer to any separate and independent place of abode intended for habitation by a household or a unit not intended for habitation but used as a usual residence by a household on census moment. To avoid technical jargon, in the manual and training of field staff, 'dwelling' was used instead of housing units.
- Collective living quarters refers to premises that are used as the usual residence by groups of people who, although usually not united by relations of marriage, blood, adoption or fostering, live together for purposes of schooling, health, detention, welfare or other reasons. Groups of people living in collective living quarters are termed 'collective households' to distinguish them from the 'private households' living in housing units. Collective living quarters were not enumerated by normal enumerators but by a special enumeration team of INETL staff members.

The 2022 census was conducted based on a de-jure enumeration, meaning that persons were enumerated in the place where they usually lived on the census moment, regardless of where they were present on the census moment. Usual residents, therefore, refer to people who have their place of usual residence in Timor-Leste, regardless of their citizenship and whether they were present or temporarily absent at their usual place of residence at the census moment. The place of usual residence is defined as the place where a person usually lived, assessed over a continuous period of six months, including the census moment. In practice, this was the place where the person lived for six months or more before and including the census night, or where the person lived for less than six months (including the census night), but intended to stay for six months or more.
The census conducted a complete enumeration of all usual household members, with a long questionnaire for members of private households and a short questionnaire for members of collective living quarters (see section 2.2.2). In addition to the usual members of the household, the census also collected some information about visitors - persons who were temporarily present in the household on the census night, but had their usual place of residence elsewhere - usual members of the household who died in the last 12 months before the census, and former household members - persons who, in the past were member of the household, but who within the previous ten years, had moved to another country to take up usual residence there.

### 2.2.2 Questionnaire development

User orientation was the leading principle in the content development of the Population and Housing Census 2022. From February 2018 onward, INETL organised a series of stakeholder consultations either in joint meetings or on bilateral basis - with relevant line ministries, interest groups, academia, UN agencies and development partners ${ }^{5}$ to understand information needs that could be met by the census. This information needs provided the basis for selecting the topics covered in the census and for

[^4]the questions to be included. For the final content and design of the census questionnaire, this assessment was balanced by various other relevant factors to produce quality census results. These main factors included the following: ${ }^{6}$

- Relevance of the census to collect data. The census is not always the most appropriate instrument to collect specific information and other data sources may be available. ${ }^{7}$
- Manageable questionnaire size. The number of topics and questions in the census questionnaire were critically assessed to avoid a too large respondent burden and exceeding data processing capacity and available census budget.
- Comparability with the 2015 census and other INETL sources, as well as international comparability and compliance to international standards and recommendations for producing statistics.
- An assessment of the data quality of previous censuses justified the removal or change of questions.
- The requirements of a digital questionnaire and the integration of a digital EA map (see section 2.2.3). These requirements, for instance, relate to recording geo codes and administrative information, procedures for starting an enumeration, instructions for enumerators and respondents, and instructions for programming the questionnaire application related to routing, built-in rangeand consistency checks and feedback to enumerators, and automated references to household members and reference dates.
- Application of good practices of questionnaire design in terms of ensuring:
- brevity of questions, using simple and consistent wording, avoiding ambiguity and combining questions;
- response categories being mutually exclusive, collectively exhaustive and directly in line with the question;
- appropriate sequencing of topics and questions, considering the sensitivity of certain topics and eligibility of persons to whom questions apply.
- Evaluation of the different internal and field tests and pilot census activities, which resulted in deleting, changing and moving questions.
The questionnaire for private households (see section Annex III) included the following main modules:
- Module DW-PR: housing unit identification and administrative information
- Module A: information about the building and housing unit
- Module B: information about the housing unit and household and interview introduction
- Module C: information about agriculture holdings (cultivated land, animals owned)
- Module D: household listing (household composition and basic demographic information)
- Module E: information about individual household members (marital status, household member relations, birth registration, migration and citizenship, education and literacy, labour market, religion and language, disability, children ever born)
- Module F: information about (maternal) deaths in the household

[^5]- Module G: information about visitors on census night (basic demographic information and usual place of residence)
- Module H: information about former household members living abroad (basic demographic information and country of residence)
- Module I: interview completion.

Based on the questionnaire developed for private households, a fully aligned short version for collective households was developed and tested. The collective household questionnaire was confined to basic demographic information, country of birth, education and disability. Both questionnaires were produced in Tetun and English.

### 2.2.3 Computer-assisted personal interviewing

## Applying CAPI in the census

Computer-assisted personal interviewing (CAPI) refers to data collection by an in-person interviewer (i.e. face-to-face interviewing), who uses a computer device to administer the questionnaire to the respondent and captures the answers onto it. CAPI with smart-phones, tablets and laptops have been standard to survey operations in developed countries and are increasingly used in developing countries, helping to take advantage of new technologies and deliver higher quality data. Nevertheless, CAPI data collection is still quite new in population and housing censuses, especially in developing countries.

The platform used in the 2022 census for developing the CAPI application was CSPro. CSPro is a public-domain software developed by the US Census Bureau, with many distinctive features, like smart synchronisation and the possibility of integrating digital maps. When using mobile devices for a census it is important to be able to transfer data collected in the field to the census headquarters. This allows for faster processing and analysis, as well as better monitoring of the progress of the field operation. In the 2022 census the enumerators used CSEntry - the Android component of CSPro - to record the data on the tablets and the internet to synchronise the data with a central cloud server.

When enumerators were able to connect to the internet, they transferred any data collected since the last synchronisation. Synchronisation was performed using a mobile data connection. For situations where an enumerator did not have access to the internet, Bluetooth was used in the CAPI application for a peer-to-peer synchronisation between tablets. With Bluetooth, an enumerator could synchronise the tablet with a supervisor's tablet, copying its data to the supervisor tablet. When the supervisor returned to a location with internet connection, the data could be synchronised with the cloud server. In this scenario, a supervisor could visit multiple enumerators to synchronise their tablets and later upload the data to the server at the census headquarters. The percentage of EAs where the internet connection was too poor to synchronise was less than 3 percent of the total areas.

## Advantages and disadvantages of CAPI

One of the main benefits of adopting a CAPI approach in a census is that data collection and data capture are combined, resulting in an integrated, faster, and more efficient collection- and capture process. This eliminates one source of error and saves time and money. The way in which routing is handled is another outstanding feature of CAPI: rather than having the enumerators apply routing instructions during the interview, the CAPI application takes interviewers automatically to the next appropriate question. This is particularly important when the questionnaire includes complex routing, as it is in a census. Similarly, if a set of questions should be asked several times (for example, for every person in the household), the application will automatically repeat the questions the correct number of times and then move on.

The routing capabilities of the CAPI application developed for the Timor-Leste Population and Housing Census 2022 had two main advantages over paper-and-pen techniques. First, the possibility of error from interviewers failing the routing instructions was eliminated: enumerators could not follow the wrong route and ask wrong questions, nor could they inadvertently skip over questions. Second, the interview flows much more smoothly since interviewers do not need to refer to previous answers to establish the correct routing through the questionnaire. For these reasons the electronic version of the census questionnaire was somewhat more complex in terms of skip patterns and routing than in the past censuses.

In the 2022 census, interviews were also made easier by customising the questions. The CAPI application has the possibility to retrieve a piece of information from the memory, such as the name of the enumerated person, and insert it in the appropriate place of a question. In this way, the accuracy of the question and the smoothness of the interview were both improved. Similarly, information that was required for a question - for example, the age in completed years at the census moment - could be retrieved from a calculation made by the application.

Another advantage of CAPI is the ability to recognise inconsistent responses that could be the result of either interviewer or respondent error. Range- and logical checks were embedded in the CAPI application for the 2022 census, which proved to be powerful features to improve the quality of the data at source. Logical checks permitted resolving a large number of inconsistencies during the interviews, resulting in less response burden and follow-up.

Adopting CAPI in the 2022 census also had some disadvantages. First, the process of converting the paper questionnaire into an electronic questionnaire was time-consuming, as often happened with the development of CAPI applications. The process necessitated several field tests, both before and after the pilot census, therefore requiring additional time between the design of the questionnaire and the census fieldwork. Second, additional training for the enumerators was required on the use of the tablets and the CAPI programme. The procurement of census tablets and additional training of INETL staff required additional effort in the census preparation phase.

## Ensuring data security

Significant security issues are always present when tablets are used for data collection. These issues are further complicated when data are transmitted to and hosted in the cloud. Data on a tablet are at risk if a tablet is lost or stolen and in the process of transmission over a mobile network, data may be vulnerable to attack. Security risks were mitigated by encrypting the tablet data and the server data, making the data more secure than if paper-based data are lost or stolen. In the 2022 census, all data transmitted from the tablets and stored on the census server were encrypted with the Advanced Encryption Standard (AES) at 256 bits. ${ }^{8}$ This standard is deemed sufficient to protect classified top-secret information.

## Integrating digital maps

The traditional role of maps in census operations consists of supporting enumeration and presenting results in cartographic form. However, the integration of digital maps in electronic data collection, using

[^6]capabilities of GIS, GPS and satellite imagery, prove to be effective. This is a relatively new approach that is not yet widely used, especially not in developing countries. The CAPI application developed for the Timor-Leste census included such integration and the digital maps of EAs were used as a base for geo-referencing both the households and the housing units and to organise the work of the enumerators. The interactive map provided them with easy navigation in the field and an overview of the enumeration status of the buildings in the EA.

With this approach and with the daily data synchronisation, it was possible to implement effective monitoring of the enumeration process. It also allowed to generate management reports on the status of the interviews, for instance in terms of response rate, number of interviews completed, number uncompleted interviews, interview duration, etc.

### 2.2.4 Census mapping and geospatial data

As stated in the UN Principles and Recommendations for Population and Housing Censuses, geospatial information plays a crucial role in national census operations, from the preparatory activities to the dissemination of census results (United Nations, 2017, p. 85). Mapping has always been an integral part of census taking, mostly for maximising the coverage of the census units, but also for increasing data quality and improving the dissemination and analysis of census results. New geospatial technologies also offer the opportunity to develop a more ambitious and sustainable census mapping strategy, as it is for the Population and Housing Census of Timor-Leste 2022.

The mapping programme for the 2022 census adopted a digital approach, based on an integrated system composed of Geographic Information System (GIS) tools, Global Navigation Satellite Systems, highresolution Earth Observation satellite images and tablets for the preparatory census mapping activities and delineation of EA boundaries.

One of the main characteristics of the adopted approach is the integration of geospatial and census data at building level, so that each building containing at least one housing unit is geocoded through unique identifiers and geographic coordinates. Such characteristic allows the aggregation of census data in any spatial dimension, not only at the level of administrative boundaries. Once disclosure control is ensured, geocoded data at building level can be used by the government and development partners at any territorial level, for instance to support planning and service delivery or for disaster preparedness and humanitarian response, in addition to supporting the generating and monitoring the indicators of the SDGs.

The geography of the Timor-Leste census was organised according to the administrative division of the country: the 14 municipalities (former districts) that also include Oecusse, a coastal exclave in the western part of the island of Timor, and the island of Atauro; the 67 administrative posts (former subdistricts); the 452 villages named sucos; and the recently established 2,231 aldeias. For the census, aldeias were generally used as EAs when containing an estimated number of 100-150 housing units in urban areas and $70-120$ housing units in rural areas. Aldeias below these ranges were grouped to form EAs of similar size and Aldeias above these ranges where split into two or more EAs. The total number of EAs was 2,384.

Preparatory mapping activities started in January 2019 with the definition of the census mapping strategy and a plan of operations. Pre-census mapping activities included the organisation of field data collection with tablets synchronised with a central server, aimed at identifying, geocoding and classifying all buildings as residential, non-residential or used for both purposes, their state of repair, as well as at identifying the total number of housing units in each building. Field activities were conducted
by ten teams composed of two surveyors each, trained and managed by the GIS Unit of the INETL. Adhoc mapping software was customised for the applications in the tablets and a web-based dashboard was developed for survey management and monitoring purposes.

Preliminary field tests showed that in comparison to the 2015 census, several urban enumeration areas in the capital Dili and in other major towns of the country had doubled their population and sometimes increased three- or four-fold, sometimes because of the arrival and settlement of newcomers from mountainous areas. To ensure that field mapping activities could locate and distinguish buildings in densely populated areas, up-to-date high-resolution satellite images at 0.5 -meter resolution were acquired for 13 urban areas in the country. Specific methodologies were applied for urban informal settlements. In rural areas, field mapping activities were limited to some areas only, and the 2015 Global Navigation Satellite Systems data on buildings were used, instead.

Field mapping was concluded in early 2022, after various interruptions due to the coronavirus pandemic and a major flood event in April 2021, which led to destruction of several thousand housing units, including vulnerable slum areas close to water courses. At the end of the pre-enumeration mapping activities, a point-based geodatabase of buildings was established and the corresponding information was uploaded in the tablets used for the census data collection (see section 2.3.2).

During the enumeration phase, the established census database was used to monitor the progress on the coverage of the collection of data and the performance of the enumerators. Data were analysed at building- and dwelling levels, taking into consideration the variables on the use of buildings and the occupancy status of the housing units.

At the end of the census data collection in late 2022, the point-based geodatabase was analysed and cleaned, and made ready to be linked to census variables through unique identifiers.

The current geodatabase also includes information on the urban and rural location of buildings. Therefore, census variables can be disseminated and analysed according to the current INETL classification of urban and rural areas. However, such classification is planned to be revised in the framework of the dissemination of the census results, by applying in Timor-Leste the internationally recognised DEGURBA statistical classification. ${ }^{9}{ }^{10}$ Other planned activities in the field of mapping include the preparation of thematic maps and outputs of spatial-related socio-economic analysis, a printed census atlas and web-based GIS applications for data visualisation and analysis.

### 2.2.5 Census publicity and communication

The success of the census depends on the quality of the information provided by the public. Therefore, advocacy and publicity for the census is an important means to increase the public understanding of the importance of the census and guarantee people's cooperation.

INETL updated the census publicity plan for the 2022 census in February 2022 after the government approved the establishment of the administrative structure for the Population and Housing Census 2022. The overall aim of the 2022 census publicity campaign was to inform all the key stakeholders about the

[^7]census. The campaign strategy identified four main target groups: government ministries and departments, traditional leaders, the media and the general public. A series of key messages were developed, including information about the census date, duration and importance. There were several census materials developed to promote census awareness. These included radio and TV adverts, a census jingle, stickers, leaflets, posters, banners, T-shirts, bags, umbrellas, hand fans, pens and notepads.

The INETL communication and public relations unit designed the census logo, developed a slogan and a census mascot. The slogan for the census was 'Our census, our future be part of it'.

Figure 2.2: Census logo and mascot

The activities of the census publicity campaign were planned to increase towards the start of the census date.. The publicity campaign was officially launched by the President of the Republic of Timor-Leste on 15 August 2022, at a high-level event held in Dili. The launch was attended by the Prime Minister, ministers, presidents of municipalities and heads of development agencies and embassies. Preceding the event was a vehicle convoy with cars in census branding that went around the capital city, playing the census jingle. The media covered the launch of the publicity campaign and the convoy.

Soon after the official campaign launch, 14 INETL publicity teams were deployed to the municipalities. Each team was assigned a branded census vehicle mounted with a public address system to facilitate sensitisation activities in the communities. Understanding the importance of the role of traditional leaders in census sensitisation in the communities, the INETL publicity teams also visited the suco chiefs while running the census campaign in the municipalities. Other publicity activities to inform the population about the census included a census briefing for the media, updates of the INETL website and census Facebook page, and a public countdown clock.

### 2.2.6 Data processing

## Data editing and imputation

As with any other data-collection operation, in the Timor-Leste 2022 census, it was common for respondents to make errors in providing answers and for enumerators in recording them, resulting in an amount of data that was not valid. Invalid responses include missing answers, out-of-range values and partial answers. Item non-response - the absence of an answer where one is expected - can be unintentional or intentional, for example when a respondent either does not know the answer or does not want to provide it. The extent of item non-response can vary greatly between questions. Items such as sex and civil status usually have few non-responses, while the level of education may have higher non-response.

It is also common for some in-range values to be considered invalid if they are inconsistent, either with other values recorded or with auxiliary information or definitions. Referred to as item inconsistency, these errors are detected by validating the data against a set of pre-defined editing rules. For example, the rule that states that a person below the age of 16 years cannot have a university degree would flag a record where the age is five and the attained level of education is university.

A good editing and imputation procedure is automatic, objective and reproducible, makes an efficient use of the matching fields, ensures that imputed records are internally consistent and have an audit trail for evaluation purposes.

The census edit- and imputation procedure included three separate processes:

- Step 1 - Inter-record imputation. The relationship of a person with the reference person in a household is complex. The answer to the question on relationship could be erroneous if not coherent with other collected information, like age, sex and civil status. Moreover, inconsistencies between the relationship with the reference person and the main demographic questions involve intra-record editing rules. For this reason, it is not appropriate to deal with it using inter-record imputation or with plain deterministic rules. Instead, imputation from the most 'similar' correct household is more powerful in finding coherent values of the structural variables.
- Step 2 - Deterministic imputation. A deterministic procedure was implemented for the correction of systematic errors. Systematic error are observed when many enumerators make the same kind of mistake in asking a specific question (or group of questions) or many respondents did not well understand the question. Deterministic corrections were applied in situations where, based on the information observed in the record and with a high level of certainty, the response was deemed to need correction. The main purpose of applying these edits was to improve the coherence of the data before next editing steps.
- Step 3 - Intra-record imputation. This aimed at resolving non-response and inconsistencies in the non-structural variables. The major advantage of this approach is that it seeks to minimise the number of changes required to repair a record, thus minimising changes to observed data.

In steps 1 and 3, probabilistic imputation was applied. Probabilistic correction is generated by an edit rule that, if violated, leads to an error of which the source cannot be identified. An example of a probabilistic edit rule is 'Civil status is married, implies that age is more than 14'. When this rule is violated, the situation is wrong, but it cannot be clearly identified where the error is: either the age or the civil status is wrong. In such cases, the editing procedure based on the Fellegi-Holt method is applied, which attempts to find the minimum number of answers that should be changed to make the record satisfying all the edit rules. This procedure adheres to the rule to keep as much as possible the information given by the respondents. After the identification of the most-likely incorrect answers, their values are corrected by means of imputation.

To avoid introducing bias, the method of imputing non-response must consider the distributional properties of the observed data. Donor-based methods are appropriate for census data because they can handle categorical and numeric variables simultaneously and will estimate the distributional properties of the data accurately.

A significant improvement in the quality of the data collected was observed due to the use of CAPI data collection. Indeed, the set of editing rules related to the questionnaire pattern applied to the data showed that less than 5 percent of the records violated at least one skipping rule, that no implausible values were recorded for gender and that just few cases had missing or implausible values in the age.

## Data coding

The 2022 census asked questions on field of study, occupation and industry that required the enumerator to the responses given by the respondents in writing. For the information on industry, the International Standard Industrial Classification of All Economic Activities (ISIC, rev 4) (United Nations, 2008) is used for response coding. The information on occupation is coded based on the International Standard Classification of Occupations (ISCO-08) (International Labour Office, 2012). The information on field of study will be coded on the basis of the International Standard Classification of Education, Fields of education and training (ISCED-F 2013) (UNESCO, 2015).

The census coding uses both manual and automated coding, using an automated coding protocol to match census information on occupation and industry with existing coded information from a codelist in Tetum that was developed for the 2019 Timor-Leste Labour Force Survey. INETL assembled a team of ten coders and three supervisors from the pool of census secretariat staff. These staff were trained by two INETL staff who worked on the 2019 Labour Force Survey. The training focussed on how to use the ISIC and ISCO codebooks that contain detailed descriptions of the industry and occupation codes.

### 2.2.7 Tabulation

Based on the edited census data, 24 main tables are presented in this report (Chapter 4). The tables were selected based on the availability of edited data and the stakeholders' needs. For the development of the tables, the following procedures were followed.

- First, a plan was made to determine the content and layout of the census tables. In October 2022, INETL developed the first list of possible tabulation outputs. This list largely followed the 2015 census tabulations, was updated in view of the 2022 census questionnaire and international recommendations, and then finetuned. From this list, 24 basic tables were selected that met essential information needs for development planning that could be produced in a minimum of time.
- A template was made in MS Excel for each of the 24 selected tables. It was decided to use the Excel platform as it is an appropriate way to publish the tables on the INETL website and allows for easy data handling and graphs by the census users. Instructions for the programmer on producing the tables, along with definitions and other metadata, were added to the templates. The recommendations on census tabulations from the UN Principles and Recommendations were closely followed in developing the templates (United Nations, 2017). Special attention was paid to following strict uniformity in titles, variables and value labels.
- As soon as the templates were ready, tables were produced based on the partially edited census data,. The tables were produced and later independently replicated using CSPro by other team members to detect possible programme errors. The tables were checked for possible data inconsistencies. This review included checks on internal consistency, such as assessments of whether or not specified universes and categories across tables covered the same number of elements, whether the same categories were defined, whether or not sub-categories in the tables added up to the totals presented, etc. Checks on the plausibility of the results were performed on their right and against information from other sources (e.g. previous census and surveys).
- The edited data were then run against the prepared programmes and included in the templates. Again checks were made for inconsistencies and, if needed, corrections were made. Next, actions were taken to ensure the non-disclosure of individuals and their personal information (see section Error! R eference source not found.).

The tables were organised to minimise the effort required to find and understand the information presented. To do so, the table title followed consistent wording that a) defines the different components of the table (universe and variables) and b) defines the table's structure in terms of the position of the variables in the columns and the rows. Each table is named in the following way:
$\langle U n i v e r s e>$, by <major row variable>, <minor row variable>, and by <major column variable>,
and minor column variable>.
'Universe' indicates the set of elements that populate the table. The 'column variable' divides the universe into different categories, with the category labels presented at the top of the column. The 'row variable' divides the universe into different categories, with the category labels on the row's left side. In most tables, row variables were presented within a table.

### 2.3 Implementation of census operations

### 2.3.1 Census timeline

The conduct of the present census was initially foreseen for 2020, five years after the 2015 census. The COVID-19 pandemic and related restrictions interrupted the census preparations and made it impossible to responsibly engage the large census workforce and visit the population for enumeration interviews. Like many other countries, the census was postponed and finally conducted in 2022.

To test parts of the census instrument, a census test was organised in December 2021. In March 2022, a concise pilot census was conducted, followed by a pilot post enumeration survey (PES). For the pilot census, five EAs were selected with different demographic and geographic profiles. The training of enumerators and the census field operations were piloted and observed by INETL staff and international experts. Similar training, field operations and monitoring were organised in the pilot PES. The census pilot data were closely examined and the examination results, together with the monitoring findings and evaluations of the enumerators, were used to finalise the census and PES instrument.

The census moment was determined for midnight of the night of 4 to 5 September 2022 (census night). This was the moment to establish the count of the population of Timor-Leste and for taking the socioeconomic and demographic snapshot of the country. The census night was followed by a four-week enumeration period, from Monday 5 September to Wednesday 5 October 2022. The census enumeration was followed by the PES data collection in 149 EAs, from 7 to 27 November 2022.

The period of October 2022 to April 2023 was used for the development and implementation of a datachecking and data-editing programme, the development and implementation of a tabulation plan and first analyses of the basic tables included in this report.

### 2.3.2 Recruitment of census staff

The recruitment of temporary census staff for the census was led by the Human Resources Unit of INETL. The recruitment was a competitive process, where all vacant positions were publicly advertised. The Human Resources Unit developed a job description for all census positions, with requirements for education- and work experience. Candidates meeting the minimum requirements were shortlisted and later interviewed for the position by a panel of selected staff from INETL.

The recruitment of temporary staff was done in two phases. The first phase was done at INETL headquarters for the following positions: publicity- and IT support, data coders and administrative support staff for the census secretariat. The second phase of recruitment of supervisors and enumerators
was done at municipality level to ensure that local staff could work close to their place of residence. This was cost-effective, as there was no additional travel cost and accommodation outside the usual residence, and enumerators could use their knowledge of the local situation.

The list of successful candidates was printed and displayed at all INETL central and municipality level offices, municipality administrator offices and administrative post administrator offices.

### 2.3.3 Training

Due to their large numbers, the training of census field staff was implemented with a cascade approach, involving three levels of training:

- At the highest level, a group of 26 master trainers were trained for seven days from 4 to 12 August 2022 by two INETL senior census staff members, supported by a UNFPA technical assistance team member. The seven-day training was conducted in a central location in Dili. The master trainers were professional technical staff selected mostly from INETL, line ministries, and UNFPA and UNICEF.
- At the next level, the master trainers conducted the training of 180 fieldstaff trainers in six parallel classes. The seven-day training of trainers was conducted from 16 to 23 August 2022 in one training centre in Dili. The trainees were INETL headquarters staff, both permanent and newly recruited census staff from the municipality census offices, administrative-post census supervisors and selected officers from line ministries and lecturers from the University of Timor-Leste.
- At the lowest level, the fieldstaff trainers conducted the training of 2,345 enumerators, 623 census supervisors and other local census staff. The eight-day training was conducted from 26 August to 2 September 2022, with 80 classes in 14 different municipality training centres across the country. On the last day of the training, the supervisors received a separate training on specific supervisor tasks.
Before the training, instruction manuals for enumerators and supervisors were developed as guidelines for the census fieldwork. Alongside the manuals, MS Powerpoint presentations were developed to improve information transfer to the field staff. The presentations also ensured that the census training was conducted in a standardised manner. The manuals and training materials covered the general principles and organisation of the census, the roles and responsibilities of the census field staff, the concepts and definitions, the content of the census questionnaire and instructions on operating the census tablet, using the digital EA map and census questionnaire, as well as aspects of genderising the census. The training included classroom mock interviews to ensure that the enumerators got familiar with the tablet applications and census interviewing.

At the beginning of the fieldwork, more than just a few enumerators dropped out or did not report for duties following successful job interviews. This necessitated hiring a group of additional enumerators to fill the gaps in the ranks. INETL trainers conducted a fast-tracked enumerator training for INETL staff, who were then deployed, mainly in Dili, where there was a need for more enumerators.

### 2.3.4 Census enumeration

The census fieldwork took place between 5 September to 5 October 2022 in all municipalities, except Dili. Due to a public holiday in the municipality, the census enumeration had to be postponed by two days.

Each enumerator was assigned an EA with, on average, 80 households in rural areas and 100 households in urban areas. EAs in urban areas were bigger, because enumerators did not need as much time as in
rural areas to go from house to house. Enumerator were expected to finish theirr assigned EA in the four weeks of fieldwork. Every enumerator was guided by a supervisor, who, on average, coordinated the work of four. Each enumerator was given a tablet with internet access, a census backpack and a census attire consisting of a branded T-shirt, vest and umbrella, and an identity card. Depending on the availability of electricity in EAs, enumerators were given a power banks for charging their tablets in the field.

Before starting the fieldwork, enumerators were instructed to download the digital map of their EA on the tablet. At each dwelling where a household could be contacted, the enumerators conducted face-toface interviews. In cases where households could not be contacted, the enumerators were instructed to make follow-up visits at different times of the day to maximise the chance of finding the household at home. Preferably the head of the household was interviewed to provide information about the dwelling and household. If the head was not available or incapable, another adult respondent was selected. Information about individual adult household members was preferably collected from the persons themselves.

After the enumeration, a sticker with a unique code was attached on or next to the front door. These stickers later served as identification for the PES. The identification code allows for easily matching the information between the census with and the PES.

The enumerators were instructed to transfer all census data on a daily basis to a INETL cloud server. This daily data transfer enabled almost real-time census monitoring by INETL headquarters. Daily reports were generated using a dashboard application to show the enumeration progress per EA. These reports included details on the number of households visited and persons enumerated. The reports were shared with the President of INETL, and the Minister and Vice Minister of Finance. Monitoring the fieldwork was done to check whether the enumerators correctly followed all census procedures in the field. The monitoring was done by supervisors, INETL technical staff, staff of UNFPA and other UN agencies, as well as members of the Census Technical Committee. A team of four international monitors from the Australian Bureau of Statistics was on board for an independent assessment of the census enumeration process.

Two weeks after census night, a small team of INETL staff started the enumeration of collective living quarters in Dili. Upon completion of their task, selected enumerators were assigned to enumerate collective living quarters in the other municipalities.

At the end of the enumeration period, all enumerators handed the tablets to the municipality census offices. INETL master trainers were sent to municipality to work alongside municipality census managers to transfer census data from the tablets, in case some enumerators had not transferred all data from their tablets. After this process, the tablets were sent back to be stored at INETL headquarters.

The enumeration of most areas was completed on 5 October 2022, as scheduled. For the remaining households where enumerators had not been able to collect information, a 'census sweeping' exercise was conducted for a period of two weeks from 19 to 28 October 2022.

### 2.4 Data limitations

The specific characteristics of a census imply that census information has many benefits for a country (see section 1.1) that merit its high costs and massive organisation. Despite these significant advantages, census data also have some limitations that must be considered while using census data. The magnitude and complexity of the census operation mean that some limitations exist in the content and quality of
the census data. As with any data source, conflicting considerations need to be taken into account, such as an almost infinite information need against respondent burden and processing capacity, national versus international information requirements and over-time comparability versus innovative improvements of definitions and procedures, and timeliness of dissemination versus completion of error correction. As much as possible, mitigation actions were executed by the census team to minimise the census data limitations and optimise their quality. Nevertheless, the following limitations are present in the census data:

- Comparability with previous censuses. Maintaining high comparability between the 2022 and 2015 censuses was a main criterion in developing the census instrument. However, changes in information needs, changes in definitions and concepts, UN recommendations, and advantages of applying innovative techniques were also taken into consideration. To some extent, this somewhat reduced the comparability with the previous census. Changes that had a direct impact on the comparability include the following:
- The shift from a de-facto to a de-jure enumeration. In 2022, persons were enumerated in the place where they usually lived on the census night. This may result in a different place of enumeration than if they were enumerated in the place where they spent the census night, which was done in the 2015 census. One implication of this shift is that in 2022, the number of persons enumerated in collective living quarters was lower, as many persons staying in collective living quarters such as patients in hospitals, hotel guests and prison inmates - do so for less than six months.
- The definitions of employment and unemployment were revised based on the latest international recommendations for labour market statistics. This effectively meant that fewer people were defined as 'employed', different people as 'unemployed' and more people as 'outside the labour force'. (see section Error! Reference source not found.).
- Urban-rural classification. Currently, the government of Timor-Leste is in the process of developing a new classification of urban and rural areas. The classification used for the census tabulation and analysis still applies the existing urban-rural classification, which is not based on statistical criteria as internationally recommended. Therefore, the present census results, including the urban-rural distribution, should be considered provisional. Once a new classification is formally adopted, the census results may be reproduced based on the revised classification.
- Information on members of collective households. The enumeration of persons living in collective living quarters was based on a separate procedure, using a questionnaire designed for data collection in these settings. Because of the difficulty of obtaining information about collective household members, the collective living quarters questionnaire was an abbreviated version of the questionnaire used for private households. For that reason, on information not collected in collective living quarters, the census can only report on information about the population in private households. The population living in collective living quarters represents less than 0.06 percent of the total population.
- Gender: Following different countries in the region, the Timor-Leste census included an extra category, 'other', for the gender question, in addition to 'male' and 'female'. In practice, this category was not really used in the field. Consequently, no 'other' gender category could be included in the tables and the analysis.
- Sensitive topics. A few topics in the census were considered sensitive by both enumerators and respondents. The most sensitive topic in the census was the disability status of each household member. As in most censuses in Asia, there is an under-enumeration of the actual number of persons
with a disability in the Timor-Leste census. For this reason, the census is not the best source to calculate the prevalence of disability in the country. On the other hand, it is one of the best sources to look at the living conditions of persons with a disability.
- Disclosure control. The population of Timor-Leste is relatively small. As a consequence, producing census tables on sub-populations or on characteristics with few observations involves the risk of violation of privacy. To protect the confidentiality of the respondents, in some tables, categories were collapsed or cell values were suppressed. Cell suppression was applied if the table cell had less than four observations and is indicated with an en-dash ('-').

Despite these data limitations found in almost any census worldwide, the census team is confident in the quality of the data and its potential for use in development planning and policy-making.

### 2.5 Post Enumeration Survey

### 2.5.1 Introduction

The INETL has taken extensive measures to ensure the quality of the census results. Despite these efforts, it is inevitable that the results will contain errors, especially because the census is such a huge and complex operation. It is therefore very important for census users to be aware of these errors and to understand their possible impact when using the census data for planning and research. In addition, the taxpayers and agencies who funded the census have the right to know the quality of the results for which they contributed financially.

Various methods are available to check the quality of census results. Among these, a post enumeration survey (PES) is the main and most powerful one. The PES is an instrument that allows the evaluation of two quality elements of the census: census coverage and reliability of specific data. The coverage analysis will allow making estimates of undercount, overcount and the coverage rate of persons, households and housing units in the census. Consequently, an estimate can also be made of the true population and the true housing stock. It will also allow making an analysis of sub-populations that have been missed during the census enumeration. In turn, incorporating PES results allows for more accurate population projections and can help improve future censuses and surveys. Following the 2022 census enumeration, INETL has conducted a PES, the results of which will become available in the second half of 2023. The next two sections briefly describe the general methodological principles of the PES and the PES implementation.

### 2.5.2 PES methodology

The general principle of the PES involves the following procedures:
1 Conducting a complete re-enumeration of a representative sample of a census unit (persons, households and housing units). This requires

- the development and testing of a PES questionnaire with questions that are relevant for estimating the census coverage and the reliability of specific data;
- the development and implementation of a probability sampling design to select EAs that will be included in the PES.

2 Trying to match each unit that is enumerated in the PES with a unit enumerated in the census. This requires specific questions in the PES and census questionnaires that enable finding matches and matching rules to determine that possible matches can be considered actual matches.

3 Producing indicators of census coverage and data reliability. Census coverage indicators are based on the 'Dual System Estimation' methodology that applies capture-recapture techniques (Chandrasekaran \& Deming, 1949).

The Dual System Estimation methodology has two important requirements:

- The PES must be independent of the census.
- The time between the two rounds of data collection (census and PES) is minimised to avoid recall errors, as well as curtail the impact of population changes through births, deaths and migration.

### 2.5.3 PES implementation

The Timor-Leste 2022 PES instrument was developed in parallel with the census. A full pilot PES was conducted in April 2002, immediately following the pilot census. The pilot PES tested the PES questionnaire, training and enumeration procedures and initial matching procedures. The PES instrument was finalised based on the pilot results and any changes in the census questionnaire and procedures that were relevant for the PES.

For the full PES, a nationally representative probability sampling design was developed, with a stratification by municipality and urban-rural location. The calculated required sample size of around 16 thousand households implied the selection of 149 EAs for full re-enumeration. The actual sample was drawn with probability-proportionate-to-size in late September to minimise possible influence on performance in the census. Other measures to preserve the independence between the census and the PES included the condition that PES field staff did not work in EAs where they were engaged during the census.

The training of the PES enumerators by INETL staff and a member of the technical assistance team was conducted from 4 to 5 November 2022. The three-week PES data collection period started on 7 November, which implied a relatively short period between the census and PES enumeration.

A consolidated PES dataset has been produced, on which structure edits will be performed. The set of matching rules and automated and manual matching procedures are currently under development. These will be tested and INETL staff will be trained in record matching and the general PES methodology. The results of the PES analysis will be available in the second half of 2023.

## 3 Census results

### 3.1 Population

### 3.1.1 Population trends

The Population and Housing Census 2022 shows that the usual resident population in Timor-Leste as of the census moment, midnight of 5 to 6 September 2022 was $1,341,737$. Of this population, 1.34 million were enumerated in private households and 812 people in collective living quarters.

Figure 3.1 shows the population trend from 2004 to 2022, as recorded in the respective censuses. The first post-independence census conducted in 2004 enumerated 923 thousand people, and the 2010 census showed that the population had exceeded the one million mark. In the past two decades, the population has steadily increased. Between the 2015 and 2022 censuses, the population increased by 156 thousand people, corresponding to a population growth of 13 percent.

Figure 3.1: Population size, 2004-2022 (in thousands) ${ }^{a}$

${ }^{\text {a }}$ Figures in this graph are based on private and collective households.
Table 3.1 shows the population size and the increase, annual growth rate and the doubling time of the Timor-Leste population between 2004 and 2022 according to the subsequent censuses. During the last two decades, the annual growth rate decreased from 2.4 percent between 2004 and 2010 to 2.1 percent between 2010 and 2015, and has further dropped to 1.8 percent between 2015 and 2022. The corresponding doubling time of the population is currently 39 years. If the current population increases at the same growth rate as today, in 39 years, the population will be twice as large.

Table 3.1: Population trend indicators, 2004-2022a

| Census | Population size | Population growth |  | $\begin{gathered} \hline \text { Annual } \\ \text { growth (perc.) } \\ \hline \end{gathered}$ | Doubling time (years) |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Absolute | Percentage |  |  |
| 2004 | 923,198 |  |  |  |  |
| 2010 | 1,066,409 | 143,211 | 15.5 | 2.4 | 28.8 |
| 2015 | 1,183,643 | 117,234 | 11.0 | 2.1 | 33.2 |
| 2022 | 1,341,737 | 158,094 | 13.4 | 1.8 | 38.7 |

[^8]Table 3.2 shows the population size in 2015 and 2022 by municipality, along with the intercensal population increase, the annual growth rate and the doubling time. Dili is the municipality with the largest population ( 325 thousand), followed by Ermera (138 thousand) and Baucau (135 thousand). These three municipalities constitute 44.5 percent of the total population of Timor-Leste. The smallest population size is in Atauro, with around 10 thousand people. Among all municipalities, the highest absolute and relative growth took place in Dili. Between 2015 and 2022, the population in Dili grew by 57 thousand persons, constituting an average annual population growth of 2.7 percent. At its current growth, Dili's population will double in size in 25 years. Three other municipalities experience annual growth above 2 percent: Ainaro, Oecusse and Liquiçá. The lowest growth currently occurs in Viqueque, with an annual growth of only 0.8 percent. It would take Viqueque about 90 years to double in size at this pace.

Table 3.2: Population trend indicators, 2015-2020, by municipality ${ }^{a}$

| Municipality | Population |  | Population growth 2015-22 |  | Doubling time (years) |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 2015 | 2022 | Absolute | Annual (perc.) |  |
| Total | 1,183,643 | 1,341,737 | 158,094 | 1.8 | 38.7 |
| Aileu | 48,837 | 54,324 | 5,487 | 1.5 | 45.6 |
| Ainaro | 63,136 | 73,115 | 9,979 | 2.1 | 33.1 |
| Atauro | 9,274 | 10,295 | 1,021 | 1.5 | 46.5 |
| Baucau | 123,203 | 134,878 | 11,675 | 1.3 | 53.6 |
| Bobonaro | 97,762 | 106,639 | 8,877 | 1.2 | 55.8 |
| Covalima | 65,301 | 73,933 | 8,632 | 1.8 | 39.1 |
| Dili | 268,005 | 324,738 | 56,733 | 2.7 | 25.3 |
| Ermera | 125,702 | 137,750 | 12,048 | 1.3 | 53.0 |
| Lautem | 65,240 | 70,022 | 4,782 | 1.0 | 68.6 |
| Liquica | 71,927 | 83,658 | 11,731 | 2.2 | 32.1 |
| Manatuto | 46,619 | 50,859 | 4,240 | 1.2 | 55.7 |
| Manufahi | 53,691 | 60,665 | 6,974 | 1.7 | 39.7 |
| Oecusse | 68,913 | 80,685 | 11,772 | 2.3 | 30.8 |
| Viqueque | 76,033 | 80,176 | 4,143 | 0.8 | 91.4 |

${ }^{\text {a }}$ Information in this table is based on private and collective households.

### 3.1.2 Age and sex composition

Figure 3.2 shows the population pyramid of Timor-Leste, illustrating the population distribution by sex and five-year age groups. Because of high past and current levels of fertility, the majority of the population is still concentrated in the younger age groups. Currently, 11.9 percent of the population is under the age of five, and about 64.6 percent of the population is currently below age 30 . However, in each of the three five-year age groups below age 15 , the number of persons is not substantially higher than those in the age group between 15 and 20 . This may indicate that the population is gradually moving towards a more mature age structure.

The sex ratio indicates the number of men per 100 women. According to the 2022 census, 681 thousand men and boys and 660 thousand women and girls were residing in the country at the census moment. This means about 21 thousand more males than females live in Timor-Leste, implying a sex ratio of 103 men per 100 women.

Figure 3.2: Population, by sex, and by five-year age group (in thousands) ${ }^{a}$

${ }^{\text {a }}$ Information in this figure is based on private and collective households.
If women were subject to identical age-specific mortality and migration rates as men, the sex ratios would be constant across the age groups and be equal to the sex ratio at birth.

Figure 3.3 presents the age-specific sex ratios for the 2022 census. In the age group $0-5$, the sex ratio stands at 105. The fact that more male than female children are present at these young ages is quite normal. In a natural demographic regime - without any sex-selective abortion - the sex ratio at birth varies typically between 105 and 107. Without any large differences between infant and child mortality between both sexes, one can expect that the sex ratio in the youngest age group is around the same level as observed in Timor-Leste. Until age 15, the sex ratio remains stable at 105 males per 100 females. Between ages 15 and 35, there is a slight drop in the sex ratio to 98 in the age group 30-34. Afterwards, the sex ratio increases gradually to reach 112 males per 100 females in the age group 50-54. It is unclear what causes the increase in the sex ratio for middle-aged persons, and a more detailed analysis will be needed to explain. After age 60, the sex ratio drops to 83 between ages 70 and 84 and drops further to 73 after age 85 . It is quite common in other countries that in the older age groups, the sex ratio decreases. Due to the higher life expectancy for women - which can be observed in most countries worldwide sex ratios are generally low for the older age groups.

Figure 3.3: Age-specific sex ratios, by five-year age group ${ }^{a}$

The sex ratios are somewhat different between the different municipalities in the country. All municipalities, except Lautém, have more males than females. In Dili, with a population of 325 thousand, there are 164 thousand males and 160 thousand females. Figure 3.4 presents the sex ratio per municipality. Manufahi has the highest sex ratio with 109 men for every 100 women, followed by Aileu, where the sex ratio is 107 . Dili has a sex ratio of 103 , the same as the national average. Having more women than men, the sex ratio in Lautém is 99.

Figure 3.4: Sex ratio, by municipality ${ }^{a}$

${ }^{\text {a }}$ Information in this figure is based on private and collective households
The characteristics of the age structure of Timor-Leste's population can be described through the dependency ratio. The population is generally divided into three different age groups to calculate dependency ratios: 0-14 and 65 and over, are called the dependent age groups, and 15-64, is called the economically active age group. The dependency ratio divides the number of persons in the dependent age groups by the number in the economically active age groups. As such, it quantifies the demographic basis for inter-generational support.

Currently, among the total population, 35 percent is below the age of 15 , and 6 percent is 65 and over. This implies a dependency ratio of 68 , which means that 100 persons in the active age groups in Timor-Leste have to support 68 persons in the dependent age groups. Compared to the 2015 census, the dependency ratio has declined from 81 to 68 dependents for every 100 people in the active age group, which is significant.

The population's age distribution is quite different across municipalities. Figure 3.5 presents the dependency ratio by municipality. By far, the lowest dependency ratio is observed in Dili, where only 51 persons in the dependent age groups are present for every 100 persons in the active age groups. A possible reason for this low dependency could be the large-scale in-migration of young adults for employment and higher education. The highest dependency ratio is in Ainaro, where 81 persons in the dependent age groups are present for every 100 persons in the economically active age groups.

Figure 3.5: Dependency ratio, by municipality ${ }^{a}$

${ }^{a}$ Information in this figure is based on private and collective households

### 3.1.3 Population density

Population density presents the number of people per $\mathrm{km}^{2}$ in a geographical unit. With a population of 1,342 million and an area of $14,950 \mathrm{~km}^{2}$, the population density currently stands at 90 persons per $\mathrm{km}^{2}$. By comparison, in 2015, the population density was 79 persons per $\mathrm{km}^{2}$.
Error! Not a valid bookmark self-reference. shows the wide variation in the population density between the municipalities. The graph clearly shows how Dili, with a population density of 1,427 persons per $\mathrm{km}^{2}$, is head and shoulders above the rest. Between 2015 and 2022, the population density in Dili increased by 149 persons per $\mathrm{km}^{2}$. The second-most densely populated municipality is Ermera, with 181 persons per $\mathrm{km}^{2}$, which means it is almost eight times less densely populated than Dili. Liquiçá - a relatively fast-growing municipality - ranks as the third-most densely populated municipality with 149 persons per $\mathrm{km}^{2}$. The least densely populated municipality is Manatuto, with 28 persons per $\mathrm{km}^{2}$. Manatuto and Viqueque changed by only two persons per $\mathrm{km}^{2}$ between the 2015 and 2022 censuses.

Figure 3.6: Population density, by municipality ${ }^{a}$

${ }^{\text {a }}$ Information in this figure is based on private and collective households

### 3.1.4 Urban-rural distribution

Out of 1.34 million people in the country, 383.0 thousand reside in urban areas, while 958.0 thousand live in rural areas. These figures show that 28.6 percent of the Timorese population lives in urban areas. In the 2015 census, 349.2 thousand people were enumerated in urban areas and 834.4 thousand in rural areas, implying that 29.5 percent of the population lives in urban areas. The annual population growth rate in rural areas is higher than in urban areas: 2.0 percent against 1.3 percent, respectively. This faster growth in rural areas has resulted in a lower percentage of the population living in urban areas compared to 2015 .

The degree of urbanisation is quite different per municipality. Error! Not a valid bookmark selfreference. shows the percentage of the population in each municipality who live in urban areas. It should not come as a surprise that most of the population in Dili lives in an urban area ( 82.4 percent). The graph shows that none of the other municipalities have a high urban population. Oecusse occupies the second place, with 18.9 percent of its people living in an urban area, followed by Lautém (18.3 percent). Ermera, Viqueque, Liquiçá, Aileu and Atauro are the least urbanised and have less than 10 percent of their population living in urban areas. Atauro takes a special position, as it is entirely rural.

Figure 3.7: Percentage of population living in an urban area, by municipality ${ }^{a}$

[^9]
### 3.1.5 Children ever born

In the census, all women 15 years and over were asked about the number of children they had ever born alive. Among all 432.4 thousand women aged 15 and over in the census, a total of 1.1 million children were born, giving an average of 2.6 children per woman. Note that this indicator is not the total fertility rate, but only a measure of life-time fertility. Figure 3.8 depicts the average number of children ever born alive by five-year age group. The distribution of the number of children born is influenced by an age effect and, to some extent, by fertility changes that have occurred over time. On average, women aged 15-19 have very few children ( 0.1 ), as they are at the beginning of their reproductive life cycle. The number of children ever born increases by age to reach a maximum of 5.3 children per woman aged 55-59. It is interesting to see that after age 65 , the average number of children drops. This could be caused by lower fertility in the past, an undercount among women at older ages or a selection if women with many children died at younger ages.

Figure 3.8: Average number of children ever born by women 15 years and over, by five-year age group

In the 2016 DHS, the question about the number of children ever born was asked of all women 15-49 years old. The mean number of children born to women in this age group was 2.1 (General Directorate of Statistics, Ministry of Health and ICF, 2018). The corresponding mean number of children in the census to women 15-49 years is 1.9 . This figure shows that in recent years fertility has further declined.

In any population, a certain proportion of women never give birth to a child. Childlessness is often measured as the percentage of women in the age group 45-49 who have never given birth (Rutstein \& Shah, 2004). The percentage of childless women seems to be quite high in Timor-Leste. In the 2016 DHS, 6.9 percent of all women aged 45-49 had never given birth to a child (General Directorate of Statistics, Ministry of Health and ICF, 2018). In the 2022 census, this percentage was even higher (9.5 percent). Figure 3.9 depicts the percentage of women aged 15 years and over who never gave birth to a child by five-year age group. As expected, the percentage of childless women drops rapidly between ages 15 and 35 , as women start a relationship and have children. Between ages 35 and $39,12.1$ percent of women never gave birth to a living child. Between ages 40 and 60 , childlessness hovers around 10 percent. The lowest level is reached between ages 45 and 49. Interestingly, between ages 60 and 85 , the percentage of women who never gave birth increases gradually to reach a level of 20.9 percent in the age group $80-84$. There is a good chance that underreporting of the actual level of fertility for older women caused these very high percentages.

Figure 3.9: Percentage of women aged 15 years and over who are childless, by five-year age group

### 3.2 Social and health characteristics

### 3.2.1 Education

No factor has an equivalent effect on socio-economic development as general education for boys and girls. SDG 4 (Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all) recognises the importance of education and aims to ensure inclusive and equitable quality education and promotes lifelong learning opportunities for all. The census is an essential source of information on progress made towards achieving the targets set by SDG 4. For this reason, several questions on education were included in the 2022 Timor-Leste Population and Housing Census. Questions on education in the census were grouped around three separate themes: 1) levels of literacy of the population five years of age and over, 2) educational attainment for persons three years of age and over, and 3) current school attendance for persons three years of age and over.

## Literacy

To accurately measure the literacy levels of the population, the census asked whether the person could read and write a short letter to a friend in any language. If the answer was positive, then it was asked whether the person could read and write such a letter in Tetun, Portuguese, Bahasa Indonesia or English. In the main tables, only general literacy is presented.

According to the census, currently, 72.4 percent of the population ten years of age and over can read and write. The literacy level is somewhat higher for males than for females: 74.7 percent against 70.0 percent. Some progress has been made compared to the 2015 Population and Housing Census. At that moment, the literacy rate for all persons ten years of age and older stood at 67.3 percent. As in the current census, in 2015, females had a lower literacy rate ( 63.9 percent) than males ( 70.6 percent) (General Directorate of Statistics, 2017).

Figure 3.10 presents the level of literacy by age for males and females of age ten and over. The graph shows the progress that has been made over the years to increase the level of literacy. Below the age of 25 , literacy hovers between 90 and 85 percent. These levels are considerably higher than among those for people aged 30 years and over. Older people's low literacy levels show that in the past, only a tiny proportion of young people had the chance to follow an education.
On the other hand, the literacy rate for the younger generations also shows that much work still needs to be done, as the country has not yet reached universal literacy. A significant trend is that the
differences between males and females have entirely disappeared at younger ages. While literacy among young persons of both sexes is about the same, the literacy rate between, for instance, men aged 60 to 65 is more than twice that of women in the same age group, 45.2 against 21.0 percent. The difference in age-specific literacy rates between men and women in older age groups indicates the disadvantaged position of women in education in the past.

Figure 3.10: Literacy rate of population aged ten years and over, by five-year age group, and by sex

Large differences in literacy exist between Timor-Leste's municipalities (Figure 3.11). Dili municipality has the highest literacy rate, with 89.6 percent of all its usual residents aged ten and over being able to read and write. This is 32.8 percentage points higher than in Oecusse, where only 56.7 percent of its usual residents aged ten and over are literate. Note the large difference in literacy rate between Dili and Manufahi, the municipality with the second highest literacy rate. In Manufahi, 75.8 percent of usual residents aged tan and over know how to read and write, which is 13.8 percentage points lower than in Dili.

Figure 3.11: Literacy rate of population aged ten years and over, by municipality

## School attendance

In the census, school attendance is defined as regular attendance at any regular, accredited educational institution or programme, public or private, for organised learning at any level of education at the time of the census. Instruction in particular skills, which is not part of the recognised educational structure of the country (for example, in-service training courses in factories), is not considered school attendance for census purposes. Note that a child enrolled in kindergarten is also considered to attend school.

According to the Population and Housing Census 2022, at the time of the census, the total schoolgoing population in the age-group 3-29 years was 422,880 , consisting of 211,218 males and 211,662 females This means that out of the population in this age category, 54.6 percent were attending school. A slightly higher percentage of young females ( 55.7 percent) than young males ( 53.6 percent) were in school. The sex ratio of the schoolgoing population aged 3-29 is exactly 100 . In the 2015 census, the sex ratio of the schoolgoing population was 109 males per 100 females.

Table 3.3 shows the percentage of school attendance by broad age groups and sex for the population aged 3-29. One of the targets for SDG 4 is that by 2030, all girls and boys will have access to quality early childhood development, care and pre-primary education to prepare them for primary education. The figures for children 3 to 5 years old, show that Timor-Leste is still far from reaching this goal. Only about one in five children in the pre-primary ages are attending school. Around four in five children aged 6-11 are in school. In other words, one in five children is still left out of primary education. It is a bit surprising that the percentage of children attending school between ages 6 and 11 is smaller than that of children between ages 12 and 17. A possible explanation may be that during the COVID-19 epidemic, parents delayed sending their children to primary education. More than a third of young people between 18 and 29 indicated they were still attending education.

Table 3.3: Percentage of population aged 3-29 years attending school, by broad age group, and by sex

| Age group | Total | Male | Female |
| :--- | :---: | :---: | :---: |
| Total | 54.6 | 53.6 | 55.7 |
| 3-5 | 20.3 | 19.2 | 21.5 |
| 6-11 | 79.9 | 78.8 | 81.1 |
| $12-17$ | 83.0 | 81.1 | 85.1 |
| $18-29$ | 33.4 | 32.8 | 34.0 |

Figure 3.12 shows a more detailed picture of school attendance by age and sex. As indicated before, pre-primary school attendance is very low. At age three, around 6 percent of children are in kindergarten; at age five, the year before primary school is supposed to start, fewer than 2 in 5 children (38.2 percent) are in school. Second, the disadvantaged position of girls from the past has completely disappeared. For all ages, the percentage of school attendance is actually somewhat higher for girls than boys. Third, school attendance is low for six-year-old children and, to some extent, for seven-year-olds. Only 62.7 percent of six-year-olds attend school, and only 77.6 percent of seven-year-olds. Fourth, no single-year age group between three and 29 years has a level of school attendance higher than 90 percent. The highest percentage is among 11-year-old children. At that age, 87.4 percent are in school.

Figure 3.12: Percentage of population aged 3-29 years attending school, by age, and by sex

### 3.2.2 Religion

The most notable fact about religion in Timor-Leste is the dominant position of Catholicism. With around 1.217 million followers, Catholicism represents 97.5 percent of the population three years of age and over (Figure 3.13). Other religions combined represent 31.5 thousand people or 2.5 percent of the population three years of age and over, of which Protestantism/Evangelicalism is the largest at 25.5 thousand or 2.0 percent of the total population. Islam, Buddhism, Hinduism, and indigenous and other religions together make up less than half a percent. A very small group of people ( 1.0 thousand or 0.1 percent) mentioned having no religion or did not want to answer the question. The distribution of religion in Timor-Leste has not noticeably changed compared to the 2015 census, when Catholicism was reported for 97.6 of the population.

Figure 3.13: Population, by religion (in percentages)

There are no noticeable differences by sex in the distribution of religion. However, a few age patterns can be distinguished. Relative to the Catholic population, people with other religions - except indigenous religions - are over-represented in the mid-adult age groups 25 to 59 and especially 30 to 54. This is likely related to immigration of foreigners from countries with a different religious composition. Indigenous religions are relatively over-represented in the older ages 55 years and over. This may indicate that this type of religion is close to disappearing. Indeed, whereas the 2015 census counted just over 900 people with an indigenous religion, in the 2022 census, this was less than 300 .

### 3.2.3 Disability

Disability is a physical, mental or psychological condition or impairment that substantially affects a person's daily activities or limits a person from performing one or more major life activities such as caring for oneself, performing manual tasks, walking, seeing, hearing, speaking, breathing, learning or working and interacting with other persons. In this context, activities refer to a wide range of deliberate actions performed by an individual as opposed to particular body functions or structures. These are basic deliberate actions undertaken to accomplish a task, such as dressing, toileting, feeding oneself or moving around the house.

In the census, the Washington Group (WG) questions on functional difficulties were used to measure the prevalence and characteristics of disability (Washington Group on Disability Statistics, 2022). Functional limitations in activities were asked in six different fields:

1. Walking
2. Seeing
3. Hearing
4. Cognition
5. Self-care
6. Communication.

As the Washington Group questions do not provide good results for young children, the questions were only asked for persons five years of age and over. For each of the six questions on functional limitations, the same four answer categories were used: 1) No - no difficulty, 2) Yes - some difficulty, 3) Yes - a lot of difficulty, and 4) Cannot do at all. There are different ways to determine whether a person has a disability. The current report will follow the Washinton Group definition of 'those who have a lot of difficulty or cannot do at all on at least one of the functional domains included in the question set' (Washington Group on Disability Statistics).

According to the 2022 Timor-Leste Population and Housing Census, 17,061 persons had one or more disabilities. This corresponds to 1.4 percent of the total population. This prevalence rate is somewhat lower than one in the 2016 DHS , when it was found that 1.8 percent of the population five years of age and over had a lot of difficulty or could not do at all at least one of the six functional domains (General Directorate of Statistics, Ministry of Health and ICF, 2018). The number of males and females with a disability is about the same: 8,517 males and 8,544 females.

Figure 3.14 shows that for both males and females, walking is the limitation affecting most persons: 3,853 males and 3,703 indicated they had a lot of difficulties or could not walk at all. The second and third most important categories are hearing and seeing. Out of 17,1 thousand persons with a disability, 7,7 thousand - or 45.5 percent - were found to have multiple disabilities. Timor-Leste follows the typical pattern in which older persons have much higher levels of disability than younger persons. Figure 3.15 shows the percentage of persons with one or more disabilities by age and sex. Only 0.3 percent of children aged $5-9$ have a disability. By age $60-64$, this is 3.9 percent, and the percentage increases to 12.6 percent for the age group 75-79. From age 85 and over, almost one in four persons indicated having a disability.

Figure 3.14: Population aged five years and over with a disability, by type of disability, and by sex (in thousands)

Figure 3.15: Age-specific disability prevalence rate by sex (in percentages)

### 3.2.4 Assistance during delivery

Each delivery should be assisted by a skilled birth attendant and should take place in a hygienic, healthy and safe environment to guarantee the health of the mother and the new-born child. The importance of skilled birth assistance is reflected in the fact that the 'proportion of births attended by skilled health personnel' is an indicator to monitor progress towards reaching Target 3.1 (By 2030, reduce the global maternal mortality ratio to less than 70 per 100,000 live births) for SDG 3 (Ensure healthy lives and promote well-being). The indicator is also closely linked to Target 3.2. on preventing deaths of newborns and children under age five. ${ }^{11}$

The 2022 census included a question on assistance during the last delivery of women who ever had a live birth. The question allowed recording more than one type of birth attendant. For women who had a live birth in the last five years before the census, this resulted in the recording of, on average, 1.4

[^10]different types of birth attendants providing assistance during delivery. Figure 3.16 shows midwives were the most common birth attendants (in 58.3 percent of deliveries), followed by doctors, traditional birth attendants and nurses, each of whom assisted in nearly a quarter of all deliveries. Other birth attendants - including relatives, neighbours and friends - attended about one in seven deliveries. A very small minority of women ( 0.9 percent) did not have any assistance during delivery.

Figure 3.16: Female population aged 15 years and over who had a live birth in the last five years, by type of assistance during last deliverya,b

${ }^{\text {a }}$ Categories do not add up to 100 percent, as deliveries can be assisted by more than one birth attendant.
${ }^{\mathrm{b}}$ TBA: traditional birth attendant.
Of the six types of birth attendants recorded in the census, doctors, nurses and midwives are considered 'skilled birth attendants'. According to the census, the percentage of deliveries at the national level that were assisted by a skilled birth attendant is 68.5 percent. This is more than was measured in the 2016 DHS (57 percent) (General Directorate of Statistics, Ministry of Health and ICF, 2018). It also implies that the increase of skilled assistance observed between 2009-10 and 2016 (from 30 percent to 57 percent) continues, although not at the same pace as before.

The national figure for skilled assistance during delivery hides considerable differences between municipalities. Skilled birth attendance ranges from 41.0 percent in Ermera ( 20 percent in 2016) to 93.3 percent in Dili ( 85 percent in 2016) (Figure 3.17). The percentage of skilled assistance also differs between urban and rural areas: 91.8 percent and 59.2 percent, respectively ( 86 percent and 45 percent in 2016).

Figure 3.17: Percentage of live births in the five years before the census assisted by a skilled birth attendant, by municipality

### 3.3 Migration

### 3.3.1 Internal migration

Of the total usual resident population born in Timor-Leste, just over 235 thousand live in a municipality that is different from their municipality of birth. This number of internal life-time migrants ${ }^{12}$ represents 17.5 percent of the total population born in the country. Table 3.4 presents the distribution of the municipality of birth and the municipality of usual residence of all persons born in Timor-Leste and resident in the country at the time of the census.

In addition to the municipality of birth and municipality of usual residence, the table presents for each municipality the population change due to internal life-time migration in absolute numbers and in terms of the net migration ratio. ${ }^{13}$ The table shows that - except for Dili - for all municipalities internal migration implies a loss of population. In absolute numbers, Viqueque (16.1 thousand), Bobonaro (17.5 thousand) and Bacau (21.1 thousand) lost the largest number of people due to internal migration.

Table 3.4: Population born in Timor-Leste: municipality of birth, municipality of usual residence, net internal life-time migration (in thousands) and net internal life-time migration ratio

| Municipality | Municipality of |  | Net internal life-time migration (thousands) | Net internal life-time migration ratio |
| :---: | :---: | :---: | :---: | :---: |
|  | Birth (thousands) | Usual residence (thousands) |  |  |
| Total | 1,330.4 | 1,330.4 | 0.0 | 0.0 |
| Aileu | 57.3 | 54.1 | -3.2 | -5.8 |
| Ainaro | 83.7 | 73.0 | -10.8 | -14.8 |
| Atauro | 11.3 | 10.2 | -1.1 | -10.5 |
| Baucau | 155.4 | 134.4 | -21.0 | -15.6 |
| Bobonaro | 123.4 | 105.9 | -17.5 | -16.5 |
| Covalima | 78.5 | 73.2 | -5.4 | -7.4 |
| Dili | 200.9 | 318.4 | 117.5 | 36.9 |
| Ermera | 152.1 | 137.4 | -14.8 | -10.7 |
| Lautém | 80.7 | 69.6 | -11.1 | -16.0 |
| Liquiçá | 83.9 | 83.2 | -0.8 | -0.9 |
| Manatuto | 55.0 | 50.6 | -4.3 | -8.5 |
| Manufahi | 65.3 | 60.4 | -4.9 | -8.1 |
| Oecusse | 86.8 | 80.1 | -6.7 | -8.4 |
| Viqueque | 96.1 | 80.0 | -16.1 | -20.1 |

As the population sizes of the municipalities differ considerably, the net migration ratio is a better measure of the impact of migration than the absolute change. The net migration ratio expresses the net

[^11]migration as a percentage of the resident population of a municipality. Also in relative terms, the same three mentioned municipalities, together with Lautém, are the ones that lost most of their population. Figure 3.18 shows the net internal life-time migration ratio for all municipalities. Half of the municipalities have lost more than 10 percent of their resident population size and Viqueque even around 20 percent.

Figure 3.18: Net internal life-time migration ratio, by municipality

Regarding internal migration, the municipality of Dili occupies a unique position. It is the only municipality with positive net internal migration (117.5 thousand people): around 130 thousand people born elsewhere in Timor-Leste now live in Dili, whereas some 13 thousand Dili-born persons now live in another municipality. These figures imply that the municipality of Dili gained 36.9 percent of its population due to internal life-time migration. The municipalities that contributed most to the population growth of Dili were Bacau (23.0 thousand), Bobonaro (16.0 thousand) and Viqueque (16.2 thousand).

There appears to be little gender difference in internal migration. The female Timor-Leste-born population that lives in a different municipality than where they were born is slightly larger than the peer male population: 117.9 thousand compared to 117.1 thousand. In relative terms, this implies that 17.8 percent of the female population engaged in internal life-time migration, compared to 17.3 percent of the male population.

### 3.3.2 International migration and citizenship

## Country of birth

Of the total resident population of 1.341 million in Timor-Leste, 10.5 thousand were born abroad. This represents 0.8 percent of the population. The majority of persons born abroad ( 6.3 thousand or 60.4 percent) live in the municipality of Dili. The percentage of foreign-born population in the other municipalities ranges from 0.5 percent in Atauro to 6.1 percent in Covalima.

Indonesia is the most important foreign country of birth. ${ }^{14}$ Some 7.7 thousand residents of Timor-Leste were born there, representing 73.6 percent of the total foreign-born population. The People's Republic of China is the second country of birth, with 7.5 percent of the foreign-born population. Portugal and

[^12]former Portuguese colonies together were the countries of birth of 8.2 percent of the foreign-born population.

## Country of citizenship

Citizenship is an important asset, as it provides individuals with legal status, identity, rights and responsibilities that are necessary for the functioning of a stable and democratic society. Citizenship gives individuals legal status and the right to reside in a particular country. It also provides specific legal rights and protections, such as the right to vote, run for public office and access to public services and benefits. Citizenship can also provide individuals with greater opportunities and access to education, employment and other resources, and can facilitate travel and mobility within their own country and abroad. In this sense, the country of citizenship is not only an indication of the legal bond between individuals and countries, but can also serve as a measure of migration.

The percentage of the population with foreign citizenship in Timor-Leste is very small. Out of the total resident population of 1.341 million people, 1.337 million (or 99.7 percent) have Timor-Leste as their country of citizenship and 4.1 thousand (or 0.3 percent) have another country of citizenship. ${ }^{15}$ The male population with foreign citizenship is 2.1 thousand, compared to a female population of 2.0 thousand (Table 3.5, panel a). The sex ratio of 106 males for every 100 females in the population with foreign citizenship is higher than that of the population with Timorese citizenship ( 102 males per 100 females).

Table 3.5: Population, by age group, and by sex, Timorese or foreign country of citizenship
a. In thousands

| Age group | Timorese or foreign country of citizenship |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total |  |  | Male |  |  | Female |  |  |
|  | Total | $\begin{aligned} & \text { Timor } \\ & \text { Leste } \\ & \hline \end{aligned}$ | Foreign country | Total | $\begin{aligned} & \text { Timor } \\ & \text { Leste } \\ & \hline \end{aligned}$ | Foreign country | Total | $\begin{aligned} & \text { Timor } \\ & \text { Leste } \\ & \hline \end{aligned}$ | Foreign country |
| Total | 1,340.9 | 1,336.8 | 4.1 | 678.3 | 676.2 | 2.1 | 662.6 | 660.6 | 2.0 |
| 0-14 | 467.0 | 466.5 | 0.4 | 239.2 | 239.0 | 0.2 | 227.8 | 227.5 | 0.2 |
| 15-29 | 399.5 | 398.9 | 0.7 | 201.3 | 200.9 | 0.3 | 198.3 | 197.9 | 0.3 |
| 30-44 | 228.3 | 226.7 | 1.6 | 114.2 | 113.4 | 0.8 | 114.1 | 113.3 | 0.8 |
| 45-64 | 171.1 | 169.8 | 1.3 | 88.8 | 88.2 | 0.7 | 82.3 | 81.6 | 0.6 |
| 65+ | 75.1 | 75.0 | 0.1 | 34.9 | 34.8 | 0.1 | 40.2 | 40.2 | 0.0 |
| a. In percentages |  |  |  |  |  |  |  |  |  |
| Total | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 |
| 0-14 | 34.8 | 34.9 | 11.0 | 35.3 | 35.3 | 11.0 | 34.4 | 34.4 | 11.0 |
| 15-29 | 29.8 | 29.8 | 16.3 | 29.7 | 29.7 | 16.3 | 29.9 | 30.0 | 16.3 |
| 30-44 | 17.0 | 17.0 | 37.9 | 16.8 | 16.8 | 36.6 | 17.2 | 17.2 | 39.4 |
| 45-64 | 12.8 | 12.7 | 31.9 | 13.1 | 13.0 | 32.6 | 12.4 | 12.4 | 31.1 |
| 65+ | 5.6 | 5.6 | 2.9 | 5.1 | 5.1 | 3.6 | 6.1 | 6.1 | 2.2 |

The age distributions of the populations with Timorese Leste and other country of citizenship are very different. Figure 3.19 shows the age and sex distribution of the population with foreign citizenship. The distribution deviates from the normal pyramid shape of the total population (see Figure 3.2 in section 3.1.2), as it has a small base at the young age groups and resembles an oveturned pyramid up to age 50 .

[^13]Compared to the population with Timorese citizenship, the population with foreign citizenship is overrepresented in the middle-aged and older working age groups 30-44 and 45-64 (see Table 3.5, panel b). The population with Timorese citizenship is over-represented in the dependent age groups (0-14 and 65 and over) and the younger working age group 15-29. The respective age distributions imply a dependency ratio of 68.1 for the population with Timorese citizenship and 16.1 for the population with foreign citizenship.

Figure 3.19: Population, by sex, and by five-year age group (in percentages) ${ }^{16}$

### 3.4 Economic characteristics

### 3.4.1 Introduction

The Population and Housing Census 2022 included questions to determine people's labour market status and employment and unemployment characteristics. The census questionnaire was designed to produce statistics compliant with the latest internationally recommended definitions of labour market concepts, as defined by the $19^{\text {th }}$ International Conference of Labour Statisticians (ICLS) (International Labour Organization, 2013). The census questions are also broadly in line with the latest work on harmonising Timor-Leste's labour force surveys (International Labour Organization, 2019). However, it should be noted that they deviate from the labour market conceptualisations in the previous censuses and comparisons should be made with much caution.

The main differences between the results produced for the Population and Housing Census 2022 and those for the 2015 census are as follows:

- In the 2022 census analysis, persons in employment are defined as all those aged 15 and over who, during the reference week before census night (29 August to 4 September 2022), were engaged in

[^14]any activity to produce goods or provide services for pay or profit. ${ }^{17}$ It excludes persons only engaged in farming-, fishing- and animal-production activities if mainly or only done for family consumption. In previous census analyses, persons only engaged in subsistence foodstuff production were included in the category 'employed persons'. The revised definition of employment implies that the number of persons who meet the criteria for being in employment has become smaller.

- In the 2022 census analysis, unemployed persons are defined as all those aged 15 and over who

1. were not in employment in the reference week, and
2. were actively looking for work or trying to start a new business in the past month, and
3. were available to take up employment within two weeks if a job would be available or a business could be started.

In previous census analyses, the second condition of actively looking for employment was dropped, because in Timor-Leste, established job-search channels are of limited relevance, as the labour market is largely unorganised and the labour force is mainly self-employed. The latest international recommendations on the definition of unemployment remove this 'relaxed definition' of unemployment to improve the comparability of labour market statistics (International Labour Organization, 2013). This implies that fewer non-employed people meet all conditions for being unemployed. However, as more people are classified as 'not in employment', according to the revised definition of employment, the potential number of unemployed persons has become larger.

### 3.4.2 Labour market status

The concept of labour market status refers to a person's current position in the labour market, indicating whether they are employed or unemployed - together constituting the labour force - or out of the labour force. The labour market status of an individual can have significant implications for their economic and social well-being, as well as for the overall performance of the economy. Understanding labour market status is essential for policymakers, economists and other stakeholders dealing with labour market dynamics, employment trends, and the overall performance of the economy.

The 2022 census collected data on labour market status and characteristics of employment and unemployment for all persons 10 years of age and over. The present analysis is limited to persons aged 15 and over.

[^15]Table 3.6 presents the numbers of persons in the considered working-age range and those in the labour force - either employed or unemployed - and outside the labour force. Whereas the male and female working-age populations are similar in size, their engagement in the labour market shows considerable differences. This results in large differences in labour market indicators, such as the labour force participation rate (LFPR) and the unemployment rate.

Table 3.6: Main labour force status categories and indicators, by sex
a. Categories (in thousands)

| Category | Total | Male | Female |
| :--- | ---: | ---: | ---: |
| Working-age population 15+ | 874.0 | 441.6 | 432.4 |
| Labour force | 313.7 | 185.0 | 128.7 |
| of whom employed | 304.7 | 180.0 | 124.8 |
| of whom unemployed | 9.0 | 5.1 | 3.9 |
| Outside the labour force | 560.3 | 256.6 | 303.7 |
| b. Indicators (in percentages) |  |  |  |
| Indicator | Total | Male | Female |
| Labour force participation rate | 35.9 | 41.9 | 29.8 |
| Employment-to-population ratio | 34.9 | 40.8 | 28.9 |
| Unemployment rate | 2.9 | 2.7 | 3.0 |

## Labour force participation rate

The LFPR rate is the proportion of the working-age population that is currently employed or unemployed. It is a key indicator in the analysis of the structure of the labour market, human resources available for the production of goods and services, and for understanding the labour market behaviour of different population groups, for instance, in terms of access to the labour market.

Of the working-age population of nearly 874 thousand people, 313.7 thousand are in the labour force, either as employed or unemployed. The male labour force includes 185.0 thousand men and boys, and the female labour force includes 128.7 thousand women and girls (

Table 3.6, panel a). These numbers translate into an overall LFPR of 35.9 percent and a male and female LFPR of 41.9 percent and 29.8 percent, respectively (

Table 3.6, panel b). These figures are lower than the findings of the latest Labour Force Survey in 2016 (with an overall LFPR of 46.9 percent), but higher than the findings of the 2010 and 2013 Labour Force Surveys (respectively 24.0 and 30.6 percent) (International Labour Organization, 2019). ${ }^{18}$

The age-specific LFPRs show consistently higher participation in the labour market for males than for females across all ages (

[^16]Figure 3.20). In absolute terms, the largest gender gap is in the age groups 30-34 to 55-59, each with more than 15 percentage points difference. The LFPR is plateauing in the age groups 35-39 to 45-49 for both men (around 62 percent) and women (around 44 percent). The highest participation rates are found in the age group $40-44$ for men ( 63.0 percent) and in the age group $40-49$ ( 44.9 percent) for women.

Figure 3.20: Labour force participation rate, by five-year age group, and by sex

## Employment-to-population ratio

The employment-to-population ratio is another important indicator used to assess the performance of a country's labour market. The indicator measures the proportion of the working-age population that is employed. Like the LFPR, it provides insights into the level of economic activity and the structure of the labour market, as well as information on the ability of the economy to generate jobs.

The census 2022 recorded 304.7 thousand workers, which is close to the total labour force (313.7 thousand persons), the difference being the number of unemployed. In the absence of high unemployment, the employment-to-population ratio is close to the LFPR. The overall employment-topopulation ratio is 34.9 percent and the male and female employment-to-population ratios are 40.8 percent and 28.9 percent. The pattern and level of the age-specific ratios are similar to the age-specific LFPRs, as shown in

Figure 3.20.

## Unemployment rate

The unemployment rate - defined as the number of unemployed persons as a percentage of the labour force - is the most widely used measure of unutilised labour supply in a country. It is considered the single, most informative labour market indicator reflecting the general performance of the labour market and the economy as a whole (International Labour Organization, 2016). This is also why the unemployment rate has been used in the Sustainable Development framework for SDG 8 (Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all), specifically to monitor the achievement of Target 8.5 (By 2030, achieve full and productive employment and decent work). However, as it does not tell anything about the economic resources of unemployed workers or their households, the unemployment rate is not necessarily an indicator of economic hardship or of well-being.

In absolute terms, the census 2022 recorded 9.0 thousand unemployed persons; 5.1 thousand males and 3.9 thousand females (

Table 3.6, panel a). The associated unemployment rates were 2.9 percent for both sexes combined and for males and females, 2.7 percent and 3.0 percent, respectively (

Table 3.6, panel b). The age-specific unemployment rates are very similar for males and females (Figure 3.21). They show a pattern of relatively high unemployment in the young working ages 15 to 29 and almost consistently declining unemployment from age 25 onward. The youth unemployment rate - the unemployment rate of persons aged $15-24$ - is 5.0 percent for males and 5.5 percent for females. This relatively high figure indicates the difficulty of entering the labour market and the vulnerable position of youth.

Figure 3.21: Unemployment rate, by five-year age group, and by sex

### 3.4.3 Reason for not working

There is a variety of reasons why people do not actively participate in the labour market. For those not working for pay or profit, the census asked the main reason for not working in the reference week of 29 August to 4 September 2022.

Overall, attending education and caring for the home or family are the most important reasons for not working (Table 3.7). Together, these categories were recorded for 65.8 percent of working-age people not working. Being engaged in subsistence food production and thinking that no work was available constituted the main reason for smaller numbers of people not working. The latter category makes up the group of 'discouraged workers' who are included in the labour market category of unemployed according to the 'relaxed definition' of unemployment. Being a pensioner, retired or of old age and being disabled, ill or in bad health was the main reason for again smaller numbers of people not working. 'Other reason' was recorded, among others, for people who worked as seasonal workers, those who lived from their own financial means or those who did not want to work.

Table 3.7: Non-working population of working age, by reason for not working, and by sex (in thousands and percentages)

| Reason for not working | a. In thousands |  |  |  | b. In percentages |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
|  | Total | Male | Female |  | Total | Male | Female |
| Total | 560.3 | 256.6 | 303.7 |  | 100.0 | 100.0 | 100.0 |
| Attended education | 179.8 | 89.3 | 90.5 |  | 32.1 | 34.8 | 29.8 |
| Took care of the home / family | 188.8 | 57.2 | 131.6 |  | 33.7 | 22.3 | 43.3 |
| Subsistence farming, fishing, animal husbandry | 66.5 | 39.8 | 26.6 |  | 11.9 | 15.5 | 8.8 |
| Thought no work was available | 48.3 | 30.5 | 17.8 |  | 8.6 | 11.9 | 5.9 |
| Was pensioner, retired, old age | 27.2 | 10.6 | 16.6 |  | 4.9 | 4.1 | 5.5 |
| Was disabled, ill, in bad health | 11.0 | 5.7 | 5.3 |  | 2.0 | 2.2 | 1.7 |
| Other reason | 38.7 | 23.4 | 15.3 |  | 6.9 | 9.1 | 5.0 |

The reasons for not working are usually closely related to age and sex.

Figure 3.22 presents the sex-specific age profiles of the non-working population of working age ( 15 and over). There is little gender difference in the age profiles for the people who reported attending education as the main reason. These are strongly concentrated in the youth aged 15-19 and 20-24. The opposite age profile concentration in the old ages - can be observed for men and women who mentioned being a pensioner, retired or of old age and, to a lesser extent, being disabled, ill or in bad health as the main reason for not working.

The age profiles of people who mentioned other reasons for not working show much more gender difference. Whereas taking care of the home or family is frequently mentioned for both males and females, it is a more relevant reason for the latter, especially for women in the mid-adult age groups 3034 to $55-59$. On the other hand, being engaged in subsistence farming is a more important reason for not working for pay or profit for men. Also, the thought that no jobs are available is a more prominent reason for not working among men than among women. For both, the ages for which the reason is mentioned are concentrated in the young adult age groups 20-24 to 30-34 and the frequency declines with age.

Figure 3.22: Age profiles of non-working males and females of working age for different main reasons for not working (in percentages)
a. Males

b. Females

### 3.5 Household and family characteristics

### 3.5.1 Household size

In the census, the household concept is based on the arrangements made by persons, individually or in groups, to provide themselves with food and other essentials for daily living. A household comprises one or more persons who usually share their housing unit and principal meals. In this section, only private households are considered, i.e. all those who do not live in a collective or institutional household. ${ }^{19}$

According to the 2022 census, $1,340,925$ persons were living in 250,270 private households. This corresponds to an average household size of 5.4 persons per household. In 2015, the number of private households was 204,597 . A population of $1,183,643$ persons then resulted in an average household size of 5.8. However, one should be careful when comparing both censuses. The 2015 census was a de-facto enumeration, while the 2022 census was a de-jure count. The average household size in the 2022 census is about the same as in the 2016 DHS, which observed 5.3 persons per household (General Directorate of Statistics, Ministry of Health and ICF, 2018).

Household sizes are quite different among Timor-Leste's municipalities (Figure 3.23). Ainaro is the municipality with the largest average household size. On average, 5.9 persons live in each private household in Ainaro. This is 1.3 persons more than in Oecusse, where only 4.6 persons can be found per household. With 5.8 persons per household, Manatuto and Aileu are also amongst the municipalities with the largest household sizes, closely followed by the capital Dili, where households, on average, consist of 5.7 persons. On the other side of the spectrum, Cocalima, Viqueque and Atauro all have average household sizes below 5 persons.

Figure 3.23: Average household size, by municipality

[^17]
### 3.5.2 Relationship to the head of household

In the census, the head of the household acts as the reference person in the household. The head of the household is the person who generally makes key decisions and is recognised by all household members as the head. The head of the household may be female or male. After identifying the reference member of the household, the relationship to the head was determined for each other household member.

Among all 250.1 thousand households, 205.6 thousand are headed by men and 44.6 thousand by women. This means that only 17.8 percent of all households are headed by women. Figure 3.24 depicts the number of persons according to their relationship to the head of household by sex. The graph clearly shows that women are most often head of household when they are not currently living together with a husband. Of all 44.5 thousand female heads, only 1.9 thousand have a husband living in the household, which is 4.2 percent. Among the 205.7 thousand male heads, 177.0 thousand have a wife, which is 86.1 percent. More sons ( 355.2 thousand) than daughters ( 310.5 thousand) live in their parents' household. The first reason is that more sons than daughters keep living in their parents' household after marriage: 20.7 thousand daughters-in-law are present, against 13.7 thousand sons-in-law. The second and more important reason is that, on average, in Timor-Leste, women marry about five years earlier than men (General Directorate of Statistics, Ministry of Health and ICF, 2018). As they leave the household at an earlier age than men to live with their new husband, it leaves more sons than daughters in the household.

Figure 3.24 shows that in Timor -Leste, households are still closely interwoven with family. In the country, less than a thousand men (859) and women (751) live in households where they are not related by marriage or blood to the head of the household.

Figure 3.24: Number of persons, by relationship to the head of household, and by sex (in thousands)

### 3.5.3 Marital status

Marital status is the personal position of each individual related to the marriage laws or customs of Timor-Leste. The question in the census had five possible categories:

1. Never married
2. Married
3. Widowed
4. Divorced
5. Separated

Figure 3.25 shows the population 14 years of age and older in private households by sex and marital status. Among the total population, the number of never-married males is considerably higher than the number of never-married females: about 222 thousand, against 175 thousand, respectively. This is clearly due to the fact that women or girls marry at an earlier age than men or boys. For instance, in the age group $20-24$, 13.1 percent of men are married, against 31.2 percent of women. Between ages 25 and $29,61.8$ percent of women have tight the knot, against 42.1 percent of men. Slightly more married females ( 231.7 thousand) than males ( 222.2 thousand) were enumerated. Marriage is not universal in Timor-Leste. Among the population aged 50 and over, living in private households, 8.3 percent of men and 6.6 percent of women had never been married. Separation and divorce remain very low in TimorLeste. According to the 2022 census, only 0.3 percent of the population was divorced, and 0.6 percent were separated.

Figure 3.25: Population, by sex, and by marital status (in thousands)

In the 2015 census, 54.6 per cent of the population aged 15 years and over were married (General Directorate of Statistics and United Nations Population Fund, 2017). Between the 2010 and 2015 censuses, the percentage of widowed persons dropped from 6.0 to 4.6 percent. According to the 2022 census, this percentage has slightly increased again during the last eight years and now stands at 5.0 percent. It is unclear whether this increase reflects a real trend or whether the rapid drop between 2010 and 2015 was partially due to an undercount of older, widowed persons in the previous census.

Figure 3.26 shows the pattern of marital status by single years of age among the population living in private households. The sharp drop in the percentage of never-married persons between the age of 20 and 35 is accompanied by a rapid increase in the percentage of married persons. The highest percentage of people in the married state occurs at age 45 when 84.4 percent of the population is married. With increasing age, the proportion of the population that has lost their spouse and has not remarried increases rapidly. At age $55,9.8$ percent of the population is widowed. This percentage further increases from 20.4 percent at age 65 to 33.5 percent at age 75 . In the oldest group of persons 85 years of age and over, almost half of the population ( 45.6 percent) are widowed.

Figure 3.26: Population in private households, by marital status, and by age (in percentages)

### 3.6 Housing characteristics and amenities

### 3.6.1 Living quarters of the population

In a census, living quarters is one of the principal units of enumeration. Living quarters are structurally separate and independent places of abode where households and individuals live. Two types of living quarters may be discerned: a) housing units, where private households live and b) collective living quarters, where collective households live. Most often, households living in collective living quarters are institutional households, such as prisons, dormitories of schools or universities, religious institutions, hospitals, etc. According to the UN Principles and Recommendations for Population and Housing Censuses, private households' housing units should be subdivided between conventional and other housing units. A conventional dwelling is defined as 'a room or suite of rooms and its accessories in a permanent building or structurally separated part thereof, which, by the way, it has been built, rebuilt or converted, is intended for habitation by one household and is not, at the time of the census, used wholly for other purposes'. Examples of conventional dwellings are houses, flats, suites of rooms and apartments (United Nations, 2017). Conventional dwellings are further subdivided into conventional dwellings with all basic facilities and dwellings that do not have all basic facilities. The following facilities must all be present to consider a conventional dwelling having all basic facilities:

1. Piped water within the dwelling
2. Toilet within the dwelling
3. Fixed bath or shower within the dwelling
4. Kitchen or other space for cooking within the dwelling.
'Other housing units' are basically all structures where people live that cannot be considered conventional dwellings and may include buildings not intended for human habitation, shelters, tents and shacks. Only a minority of people in Timor-Leste live in non-conventional (other) housing units. A mere 1,629 people were classified as living in other housing units 849 were living in buildings not intended for human habitation, 243 lived in shelters, tents and shacks, and 488 lived in other structures. Among all 1,340,933 persons in Timor-Leste, 1,340,925 live in private housing units and 812 in collective living quarters.

Most people in Timor-Leste have to do with a lack of, at least some, basic facilities in the housing unit. Among all persons living in a conventional dwelling, only 27.4 thousand people have all the basic
facilities in the dwelling. Dili scores highest, but also here, only 5.4 have all the basic facilities in the dwelling. Atauro is the municipality with the least dwellings with all basic facilities ( 0.2 percent).

### 3.6.2 Characteristics of housing units

The characteristics of housing units are important to measure the living conditions of households residing in the units. In the census, various questions were asked about the characteristics of the housing units. These questions included information about the type of ownership and tenure of the housing unit, the condition of the housing unit, the construction material used for walls, roof and floor, the year of construction, availability, and type of bathing, and toilet facilities. In this first release of census tables, information is provided on the type of housing unit, the occupational status of the housing unit, and the type of material used for the walls.

## Construction material of walls

Currently, 55.9 percent of housing units have concrete or brick walls (Figure 3.27). The percentage is more substantial in urban areas ( 81.6 percent) than in rural areas ( 45.6 percent). The quality of housing construction in Timor-Leste has improved during the last few years. In the 2015 census, only 38.3 percent of houses had concrete or stone walls. At that time, 72.4 percent of housing units in urban areas had stone or concrete walls, and 26.0 percent in rural areas.

Palm trunk (bebak) is the second-most common wall material used. In rural areas, 19.5 percent of all housing units have palm trunks as wall material. In urban areas, this is much less ( 6.9 percent). About one in seven Timor-Leste housing units have bamboo walls ( 14.4 percent). While this is 19.6 percent in rural areas, just a few houses in urban areas use bamboo as construction material for walls (1.2 percent).

Figure 3.27: Occupied housing units, by type of construction material of outer wall, and by urban/rural residence (in percentages)

## Occupancy status of conventional dwellings

Figure 3.28 shows the percentage of vacant dwellings among all conventional dwellings per municipality. Nationally, 9.5 percent of all conventional dwellings are vacant. Little difference exists between urban and rural areas: 9.7 and 9.4 percent, respectively. All municipalities that are situated
around Dili have higher levels of vacant dwellings: Atauro (15.6 percent), Liquiçá (12.7 percent), Manatuto ( 12.6 percent) and Aileu ( 12.5 percent). The only exception is Covalima, which is further away from Dili, but still has more vacant conventional dwellings (13.8 percent). The fact that Dili is a major pool of attraction for internal migrants is shown by the low level of vacant dwellings ( 7.6 percent). Other municipalities with low vacancies are Viqueque and Bobonaro.

In most municipalities, the percentage of vacant conventional dwellings is much higher in urban than in rural areas, with the exception of Dili. However, one has to keep in mind that roughly twice as many dwellings are situated in Dili than in all other urban areas in the country together (51.0 thousand in Dili against 25.8 thousand in all other urban areas).

Figure 3.28: Percentage of vacant conventional dwellings, by municipality, and by urban/rural location

### 3.6.3 Drinking water

In the census, a question was asked about the household's primary source of drinking water to measure the availability of safe drinking water to the household. The WHO/UNICEF Joint Monitoring Programme for Water Supply and Sanitation uses a specific classification to classify safe drinking water services (United Nations, 2023). The criteria to classify drinking water services are 'improved' or 'unimproved' type of drinking water sources, accessibility of drinking water on the premises, the time required to collect drinking water, including queueing, the availability of water if needed and absence of contamination. For this report, improved or unimproved drinking water sources are the most important. An improved drinking water source can deliver safe water through its design or construction. The following types of water supplies are considered a source of improved drinking water: piped supplies and non-piped supplies (such as boreholes, protected wells and springs, rainwater, and packaged or delivered water, e.g. by tanker trucks). Unimproved water sources do not protect against bacterial and chemical contamination. These sources include rivers, streams, irrigation channels and lakes.

Figure 3.29 shows that most occupied housing units rely on public taps or public piped water (39.5 percent). Only a minority of 10.2 percent of all housing units have piped or pumped water in the house, and 11.0 percent have a private water source in the yard. Bottled water and water delivered by a water vendor account for 8.8 and 2.3 percent of all housing units, respectively. The graph shows that people in 8.7 percent of all housing units depend on rivers, streams, lakes, ponds and irrigation channels to get drinking water, and 4.3 percent obtain their drinking water from unprotected wells and unprotected
springs. This means that unimproved drinking water sources are used in 13.0 percent of all housing units.

According to the 2016 DHS, at that time, 20.9 percent of all households used an unimproved type of drinking water supply: 13 percent got water from an unprotected spring, 4 percent from rivers, lakes or ponds and 3 percent from unprotected wells (General Directorate of Statistics, Ministry of Health and ICF, 2018). These figures show that progress has been made in the last eight years towards a nationwide use of improved water sources.

Figure 3.29: Occupied housing units, by type of drinking water source (in percentages)

Table 3.8 shows important differences between urban and rural areas. While 16.8 percent of housing units in urban areas have piped or pumped water inside the housing unit, this is only 7.7 percent in rural areas. In rural areas, people in 44.4 percent of housing units depend on public taps and piped water, against only 26.5 percent in urban areas. Public taps and piped water are the most important sources of drinking water in rural areas. People in urban areas rely more on bottled water ( 27.9 percent). In rural areas, in only 1.6 percent of the housing units, people rely on bottled water. In 18.6 percent of all housing units, people have to rely on unimproved drinking water sources in rural areas, against 8.0 percent in urban areas. It is interesting to see that compared to the 2016 DHS, the percentage of unimproved sources of drinking water has decreased from 25.5 percent to the current level of 18.6 percent, but the level of unimproved water sources in urban areas has gone up from 6.5 to 8.0 percent (General Directorate of Statistics, Ministry of Health and ICF, 2018).

Table 3.8: Occupied housing units, by type of drinking water source, and by urban/rural location (in percentages)

| Drinking water source | Total | Urban | Rural |
| :--- | ---: | ---: | ---: |
| $a$. Improved water source |  |  |  |
| Public tap / public piped water | 39.5 | 26.5 | 44.4 |
| Piped or pumped to the yard/plot | 11.0 | 8.5 | 11.9 |
| Piped or pumped into the dwelling | 10.2 | 16.8 | 7.7 |
| Protected well / protected spring | 9.1 | 4.2 | 10.9 |
| Bottled water | 8.8 | 27.9 | 1.6 |
| Tube well / bore hole | 5.5 | 7.9 | 4.6 |
| Water vendor / tank | 2.3 | 5.7 | 1.0 |
| Other | 0.4 | 0.1 | 0.5 |
| Rainwater collection | 0.2 | 0.1 | 0.3 |

b. Unimproved water source

| River/stream/lake/pond/irrigation channel | 8.7 | 1.1 | 11.6 |
| :--- | :--- | :--- | ---: |
| Unprotected well / unprotected spring | 4.3 | 1.2 | 5.5 |

Time to get to an improved water source is an important indicator for safe drinking water service. A cut-off point of 30 minutes for a return trip to get water, including queueing time, is used to distinguish between basic and limited drinking water service levels.

Figure 3.30 depicts the percentage of housing units where people need more than these 30 minutes by type of water source and type of residence. The graph shows that a considerable proportion of households in Timor-Leste still encounter grave difficulties in collecting safe drinking water. Among households that rely on rivers, streams, lakes, ponds or irrigation channels to get drinking water, 34.3 percent need more than 30 minutes to collect it. Almost 30 percent of households that get water from unprotected wells or springs also have to spend more than 30 minutes to get water. Also, for the other water sources, more than just a few households spend considerable amounts of time providing water to their homes. As could be expected, the percentages of households that spend more than 30 minutes are considerably higher in rural areas than in urban areas.

Figure 3.30: Percentage of occupied housing units where households need more than 30 minutes to fetch drinking water, by type of drinking water source, and by urban/rural location

### 3.6.4 Sanitation

In a similar way to the classification of drinking water services, the Joint Monitoring Programme for Water Supply and Sanitation developed a classification system for identifying sanitation services. A distinction was made between improved and unimproved types of sanitation facilities. Human excreta is separated from human contact hygienically in an improved sanitation facility. Facilities which do this are flush and pour flush toilets connected to sewers, septic tanks or pit latrines (wet facilities), ventilated improved pit latrines, pit latrines with slabs and composting toilets (dry facilities). Unimproved facilities do not separate excreta from human contact.

Census information on sanitation is closely related to SDG 6 (Ensure availability and sustainable management of water and sanitation for all). In the census, three questions were related to the toilet facilities: 1) type of toilet, 2) waste disposal, and 3) whether or not others share the toilet.

Figure 3.31 depicts the type of toilet by type of residence. Most housing units in Timor-Leste have either a pit latrine with slab ( 43.2 percent) or a flush/pour flush toilet ( 37.4 percent). Nine percent of all housing units have no toilet facilities and use open defecation in the bush, fields, shores, ocean, rivers, ponds or lakes. Of all housing units, 6.3 percent use pit latrines without slabs or open pits, and 3.2 percent use a hanging toilet. While 48.4 percent of housing units have a flush or pour flush toilet in urban areas, this is only 32.9 percent in rural areas.

The toilet facilities of hanging toilets, buckets and pit latrines without slabs and no facilities can be considered unimproved sanitation facilities. As such, 18.9 percent of all housing units have unimproved sanitation facilities. In rural areas, this percentage is much higher than in urban areas: 24.3 against 4.7 percent. If the toilet facility was flush/pour flush, a question was asked about the run-off of the toilet. Among all housing units with a flush/pour flush, 67.6 emptied into a piped sewer system, 18.9 percent used a septic tank, 9.9 percent used a soakage pit and 3.6 percent elsewhere, such as an open sewer, the street or into the environment.

Figure 3.31: Occupied housing units, by type of toilet, and by urban/rural location (in percentages)

The census asked whether the toilet facility was shared with other households for all types of toilets, except in the case of 'No facility'. The answer categories to this question were 1) No, only used by this household (private facility), 2) Yes, shared with designated other private households, and 3) Yes, public toilet. Table 3.9 shows that most people in housing units with a toilet facility have a toilet only used by household members ( 86.4 percent); 12.3 percent shared their toilet facilities with other designated private households and 1.3 percent of have to depend on public toilets. Among the types of toilets, 'Other' forms the exception, with 36.2 percent of people in these households relying on public facilities and 32.5 percent sharing the toilet with others. In some places, hanging toilets are used as public toilets. Among the users of hanging toilets, 12.4 percent use them as a public facility. However, as shown in Figure 3.31 the percentage of households using hanging toilets or other types of toilets is very small.

Table 3.9: Toilet facilities, by type of toilet facility, and by toilet-sharing status (in percentages)

| Type of toilet | Private | Shared with <br> designated <br> households | Public <br> toilet |
| :--- | ---: | ---: | ---: |
| Total | 86.4 | 12.3 | 1.3 |
| Pour / pour flush toilet | 87.5 | 11.9 | 0.7 |
| Pit latrine with slab | 86.6 | 12.8 | 0.6 |
| Pit latrine without slab /open pit | 86.4 | 12.2 | 1.4 |
| Hanging toilet/latrine | 79.0 | 8.7 | 12.4 |
| Bucket | 85.9 | 11.0 | 3.1 |
| Other | 31.3 | 32.5 | 36.2 |

## 4 Basic tables

Table 4.1: Population, by municipality, administrative post, suco, and by urban/rural location, sex

## Annex II Concepts and definitions

Age: The interval of time between the date of birth and the census day (5 October 2022), expressed in completed solar years.

Basic facilities: Conventional housing units must at least have the following facilities (United Nations, 2017):

- Piped water within the dwelling
- Toilet within the dwelling
- Fixed bath or shower within the dwelling
- Kitchen or other space for cooking within the dwelling.

Conventional housing units without basic facilities have the essential features of a conventional dwelling, but not all of the basic facilities.

Birth certificate: A birth certificate is a document issued by the state to the parent or caregiver of the child as a result of birth registration. A birth certificate is the legal document that proves that registration has occurred (UNICEF, 2023).

Birth registration: Birth registration is the process of recording a child's birth. It is a permanent and official record of a child's existence and provides legal recognition of that child's identity. At a minimum, it establishes a legal record of where the child was born and who his or her parents are. Birth registration is required for a child to get a birth certificate - his or her first legal proof of identity' (UNICEF, 2023).

Census: A census is the complete count of all individuals, households and dwellings within the territory of a country, at a single point in time and provides the picture of the demographic, economic, social and housing characteristics in the country.

Census day: Census day is the day following census night and is the first day of the census enumeration period. In the Timor-Leste Population and Housing Census 2022, census day was Monday, 5 September 2022.

Census moment: Census moment is midnight of the census night. This moment is the critical point in time for determining who to include in the census enumeration.

Census night: Census night is the night in which the census moment is located, the night of Sunday, 4 to Monday, 5 September 2022.

Children ever born alive: Information on number of children born alive (life-time fertility) includes all children born alive (that is to say, excluding foetal deaths) during the life-time of the woman concerned up to the census date. Itincludes all live-born children, whether born in or out of marriage, whether born in the present or a prior marriage, or in a de-facto union, or whether living or dead at the time of the census. In the event of multiple births (e.g. twins), each child is be counted as individual birth (United Nations, Department of Economic and Social Affairs, Statistics Division, 2017).

Country of citizenship: Country of citizenship is defined as the country an individual is a citizen of and with which the individual enjoys a particular legal bond, acquired by birth, naturalisation, marriage or some
other mechanism. A citizen is a legal national of the country of enumeration; a foreign citizen is a nonnational of the country (that is, a citizen of another country or a stateless person). (United Nations, 2017).

Collective households: Collective households are groups of people who, although usually not united by relations of marriage, blood, adoption or fostering, live together in a collective living quarters for purposes of schooling, health, detention, welfare or other reasons.

Collective living quarters: Collective living quarters include structurally separate and independent places of abode intended for habitation by large groups of individuals or several households and occupied at the time of the census. Such quarters usually have certain common facilities, such as cooking and toilet installations, baths, lounge rooms or dormitories, which are shared by the occupants. They may be further classified into hotels, rooming houses and other lodging houses, institutions and camps.

Construction material of outer walls: This refers to the construction material of external (outer) walls of the building in which the living quarters is located. If the walls are constructed of more than one type of material, the predominant type of material is reported (United Nations, 2017).

- Conventional dwelling: A 'conventional dwelling' is a room or suite of rooms and its accessories in a permanent building or structurally separated part thereof which, by the way it has been built, rebuilt or converted, is intended for habitation by one household and is not, at the time of the census, used wholly for other purposes. It should have separate access to a street (direct or via a garden or grounds) or to a common space within the building (staircase, passage, gallery and so on). Therefore, there are four essential features of a conventional dwelling (United Nations, 2017).
- It is a room or suite of rooms
- It is located in a permanent building
- It has separate access to a street or to a common space
- It was intended to be occupied by one household.

De-facto enumeration: See 'de-jure enumeration'.
De-jure enumeration: In a census applying de-jure enumeration, people are enumerated in the place where they usually lived on the census night, regardless of where they were on census night. In a census applying de-facto enumeration, people are enumerated in the place where they were present on the census night, regardless of where they usually lived on that night. The 2022 census applied the de-jure enumeration.

Disability status: Disability status characterises the population into those with and without a disability. Persons with disabilities are defined as those persons who are at greater risk than the general population for experiencing restrictions in performing specific tasks or participating in role activities. This group would include persons who experience limitations in basic activity functioning, such as walking or hearing, even if such limitations were ameliorated by the use of assistive devices, a supportive environment or plentiful resources. Such persons may not experience limitations in specifically measured tasks, such as bathing or dressing, or participation activities, such as working or going to church or shopping, because the necessary adaptations have been made at the person or environmental levels. These persons would still, however, be considered to be at greater risk of restrictions in activities and/or participation than the general population because of the presence of limitations in basic activity
functioning, and because the absence of necessary accommodations would jeopardise their current levels of participation (United Nations, 2017).

Disability, type of: The Washington Group questions on functional limitation were used to specify the type of disability (Washington Group on Disability Statistics, 2022). The Washington Group questions discern between the following types of functional limitations:

- Walking
- Seeing
- Hearing
- Cognition
- Self-care
- Communication

Drinking water source,types of: The following types of sources of drinking water were used in the census

- Piped or pumped into dwelling: Pipe connected with in-house plumbing to one or more taps, e.g. in the kitchen and/or bathroom. Sometimes called a house connection.
- Piped or pumped to the yard/plot: Pipe connected to a tap outside the house in the yard or plot. Sometimes called a yard connection.
- Public tap or standpipe: Public water point from which community members may collect water. A standpipe may also be known as a public fountain or public tap. Public standpipes can have one or more taps and are typically made of brickwork, masonry or concrete.
- Tube well or borehole: A deep hole that has been driven, bored or drilled with the purpose of reaching ground water supplies. Water is delivered from a tube well or borehole through a pump which may be human, animal, wind, electric, diesel or solar- powered.
- Protected dug well: A dug well that is 1) protected from runoff water through a well lining or casing that is raised above ground level and 2) a platform that diverts spilled water so that it cannot fall down the hole. Both conditions must be observed for a dug well to be considered as protected.
- Protected spring: A spring protected from runoff, bird droppings, and animals by a 'spring box' which is typically constructed of brick, masonry, or concrete and is built around the spring so that water flows directly out of the box into a pipe without being exposed to outside pollution.
- Rainwater: Rain that is collected or harvested from surfaces by roof or ground catchment and stored in a container, tank or cistern.
- Bottled water: Water that is bottled and sold to the household in bottles.
- Not-protected dug well: A dug well which is 1) unprotected from runoff water; 2) unprotected from bird droppings and animals; or 3) both.
- Not-protected spring: A spring that is subject to runoff and/ or bird droppings or animals. Unprotected springs typically do not have a 'spring box'.
- Tanker truck: Water is obtained from a provider who uses a truck to transport water into the community. Typically, the provider sells the water to households.
- Cart with small tank: Water is obtained from a provider who transports water into a community using a cart and then sells the water. The means for pulling the cart may be motorised or non-motorised (e.g., a horse).
- Surface water: Water located above ground and includes rivers, dams, lakes, ponds, streams etc.
- Other: Source which is not covered above.

Employed population: In the census, employed persons are defined as all those aged 15 and over who, during the reference week before census night (29 August to 4 September 2022), were engaged in any activity to produce goods or provide services for pay or profit (International Labour Organization, 2013). They include those 'at work' (those who worked in a job for at least one hour in the reference week) and employed persons 'not at work', due to temporary absence because of, for instance, illness, vacation, pregnancy. They exclude persons only engaged in farming-, fishing- and animal-production activities if mainly or only done for family consumption.

Enumeration: Enumeration is the process of taking a count and the collection of demographic and socioeconomic information from all persons constituting part of a population in a given territory and at a given moment (census moment).

Enumeration area (EA): An enumeration area is a small geographic unit, into which the country is divided for census and statistical purposes, and for which enumerators are required to undertake the necessary enumeration in the required period.

Enumeration area (EA)map: The EA map is a digital map integrated into the digital questionnaire application on the census tablet. The EA map shows the boundaries of the EA roads and orientation points, as well as buildings where the enumeration should be done.

Enumeration period: This is to the period when the census data were collected in the field. In the 2022 census, the enumeration period was from 5 September to 5 October 2022.

Enumerator: Enumerators are part of the census field staff, performing the task of enumerating the dwellings, households and persons in the EA assigned to them.

Foreign-born population: Persons not born within the current territory of the Democratic Republic of Timor-Leste.

Former household member: For the purpose of the census, a 'former household member' is defined as a person who in the past was a member of the household being enumerated, but who, within the previous ten years, has moved to another country to take up usual residence there.

Gender/Sex: Various countries in the Asian region nowadays distinguish three categories of gender/sex in their census questionnaires: 1) male, 2) female and 3) other. The 'other' answer category is added to avoid that persons who identify themselves as gender non-binary, trans or anything other than male or female would feel excluded. In practice, in the field enumrators did not use the third category and as such this category cannot be found back in the tables.

Head of household: The head of the household is the person who generally makes key decisions and is recognised by all household members as the head of the household. The head of the household may be female or male.

Household: A household is defined as one or more persons who usually share their dwelling and their principal meals or other essentials for living. A household may be either:

- A one-person household, that is to say, a person who makes provision for his or her own food or other essentials for living without combining with any other person to form part of a multiperson household; or
- A multiperson household, that is to say, a group of two or more persons living together who make common provisions for food or other essentials for living. The persons in the group may pool their resources and have a common budget; they may be related or unrelated persons or a combination of persons, both related and unrelated.

Housing unit: A housing unit is a separate and independent place of abode intended for habitation by a single household or one not intended for habitation, but occupied as living quarters by a household at the time of the census. Thus it may be an occupied or vacant dwelling, an occupied non-conventional housing unit or any other place occupied as living quarters by a household at the time of the census. (United Nations, 2017).

Illiteracy: See 'literacy'.
Level of education: The following categories are used in the census with regard to education:

- Kindergarten
- Primary
- Pre-secondary
- Secondary general
- Secondary technical
- Polytechnic / diploma
- University bachelor
- University master
- University Phd

Literacy: A literate person is one who can both read and write a short, simple statement on his or her everyday life. An illiterate person is one who cannot, with understanding, both read and write such a statement. (United Nations, 2017).

Living quarters: Living quarters are structurally separate and independent places of abode. They may: 1) have been constructed, built, converted or arranged for human habitation, provided that they are not at the time of the census used wholly for other purposes and that, in the case of non-conventional housing units and collective living quarters, they are occupied at the time of the census; or 2 ) though not intended for habitation, were in use for such a purpose at the time of the census (United Nations, 2017).

Marital status: Marital status in the census is any of five legal statuses:

- Single (in other words, never married);
- Married;
- Married, but separated;
- Widowed and not remarried;
- Divorced and not remarried. '
'Married' involves a formal legal bond between two partners and does not include extra-legal stable unions such as consensual unions. 'Divorced' means that the legal bond between the married couple was officially ended. 'Separated' means that the partners no longer live together, but that the marriage has not been legally annulled. A person who is widowed has lost her/his spouse through dead and did not remarry (yet).

Native born: Persons born within the current territory of the Republic of Timor-Leste.
Other housing unit: A housing unit that is not a conventional dwelling (United Nations, 2017). Other housing units may be

- semi-permanent housing units, which are not meant to last a long period of time
- mobile housing units
- informal housing units (either makeshift shelters constructed of waste materials and generally considered unfit for habitation (squatters' huts, for example) or places that are not intended for human habitation although in use for that purpose at the time of the census (barns, warehouses, natural shelters and so on).

Outside the labour force: Persons outside the labour force comprise all those who, in the reference week before the census ( 29 August to 4 September 2022) were neither employed nor unemployed as defined above, including persons below the the working age of 15 years and over (United Nations, 2017).

Population density: Population density is the population divided by land area in square kilometres.
Private household: see 'household'.
Relationship to the head of household: The relationship to the head of the household refers to the type of a household member's relation to the head of the household in terms of blood descent, marriage or adoption.

School attendance: School attendance is defined as regular attendance at any regular accredited educational institution or programme, public or private, for organised learning at any level of education at the time of the census (United Nations, 2017).

Sex ratio: Sex ratio is the number of males per 100 females.
Toilet, type of: The following types of toilets were used in the census:

- Fush/pour flush toilet: A flush toilet uses a cistern or holding tank for flushing water and has a water seal., which is a u-shaped pipe, below the seat or squatting pan that prevents the passage of flies and odours. A pour flush toilet uses a water seal, but unlike a flush toilet, a pour flush toilet uses water poured by hand for flushing (no cistern is used).
- Pit latrine with slab: uses a hole in the ground to collect the excreta and a squatting slab or platform that is firmly supported on all sides, easy to clean and raised above the surrounding ground level to prevent surface water from entering the pit. The platform has a squatting hole, or is fitted with a seat.
- Pit latrine without slab /open pit: same as above, but without slab.
- Hanging toilet/latrine: a toilet built over the sea, a river, or other body of water allowing excreta to drop directly into the water.
- Bucket: involves the use of a bucket or other container for the retention of faeces (and sometimes urine and anal cleaning material), which is periodically removed for treatment or disposal.
- No facility: open defecation in the environment, for example, bush, beach, river, stream, and so forth
- Other: none of the above.

Unemployed population: In the census, unemployed persons are defined as all those of working age age (15 and over) who were

- not in employment in the reference week,
- actively looking for work or trying to start a new business in the past month, and
- available to take up employment within two weeks if a job would be available or a business could be started (International Labour Organization, 2013).

Urban/rural location: No universal definition exists for the features that distinguish urban and rural locations. This is because many countries have specific rules to classify areas as either urban or rural. In the case of Timor-Leste there is no gazetted definition of urban or rural areas. The classification currently used by INETL - and in the census - is based on a definition of urban areas being suco's with at least 5 thousand population and with education, health and market facilities, as well as with access to water supply and sanitation, electricity, radio and television, public administration and transportation. Suco's that do not meet these criteria are defined as rural. However, there are a few exceptions, where the population size criterion was relaxed and the suco is still classified as urban.

Usual residence, place of. The place of usual residence in the census is defined as the place where a person usually lived, assessed over a continuous period of six months, including the census moment. In practice, this was the place where the person lived for six months or more before and including the census night, or where the person lived for less than six months (including the census night), but intended to stay for six months or more.

Usual residents: For the census, usual residents are the persons who, at the census moment, had their place of usual residence in the Democratice Republic of Timor-Leste, regardless of their citizenship and whether they were present or temporarily absent at their usual place of residence at the census moment.

Visitor: A visitor is defined as a person who temporarily stayed with the household on census night, for example to visit family or friends. Visitors also include persons who stayed at the dwelling on census night if it was for seasonal use or as a second home only.

Working age: For the basic labour-force information in the census, the working age of 15 years and over is applied.

## Annex III Questionnaire for private households

The Population and Housing Census 2022 used CAPI for data collection. This annex provides the digital questionnaire application used for enumerating housing units and private households. The following colour coding is applied in the questionnaire:

- Black font is used for numbers and labels of variables, and codes and labels of values.
- Blue font is used for questions that were asked to respondents
- Green font is used for instructions to enumerators and questions that were answered by enumerators
- Red font is used for instructions to the programmer of the questionnaire application.

| H 4 | Gender former member What is <Former member>'s gender? | 01 Male <br> 02 Female <br> 03 Other |  |
| H 5 | Relationship to the head <br> What is <Former member>'s relationship to the current head of household? | 02 Spouse (husband/wife) <br> 03 Daughter/son <br> 04 Adopted child or stepchild <br> 05 Daughter-in-law/son-in-law <br> 06 Mother/father <br> 07 Sister/brother <br> 08 Father-in-law/mother-in-law <br> 09 Sister-in-law/brother-in-Law <br> 10 Grandchild <br> 11 Grandparent <br> 12 Other relative <br> 13 Live-in domestic servant <br> 14 Other non-relative |  |
| H 6 | Age former member What is <Former member>'s age? If less than 1 year, write ' 0 ' |  |  |

| H 7 | Current country of residence 02 Angola <br> In which country does <Former member> 03 Australia <br> live? 04 Bangladesh <br>  05 Brazil <br>  06 Brunei <br>  07 Cambodia <br>  08 Canada <br>  09 Cape Verde <br>  10 China <br>  11 Cuba <br>  12 France <br>  13 Germany <br>  14 Guinea-Bissau <br>  15 India <br>  16 Indonesia <br>  17 Ireland <br> $\ldots$ $\ldots$  <br>  36 Other country | Go to H9 |
| :---: | :---: | :---: |
| H 8 | Current region of residence 01 Africa <br> In which region is this country located? 02 Americas and the Caribbean <br>  03 Asia <br>  04 Europe <br>  05 Pacific <br>  06 Don't know |  |
| H 9 | Main reason of migration 01 Education or training <br> What was <Former member>'s main 02 Employment <br> reason for emigration? 03 In search of employment <br>  04 Marriage <br>  05 Followed family <br>  06 Conflict <br> 07 Natural disaster  <br>  08 Other <br>  09 Don't know | $\left[\begin{array}{c}\text { Go to } \\ \mathrm{H} 11\end{array}\right.$ <br> Go to H 11 |
| H 10 | Specify other reason <br> Specify other reason for emigration |  |
| H 11 | Years abroad <br> For how many years has <Former $\square$ member> been living abroad? <br> If less than 1 year write ' 0 ' <br> If 'Don't know, write '99' |  |

[^0]:    Table 4.24: Occupied housing units, by urban/rural location, type of toilet, sharing status of toilet facility, type of sewage disposal, and by broad type of housing unit, type of housing unit 136

[^1]:    ${ }^{1}$ Preliminary census results were produced in November 2022 (Government of Timor-Leste, 2022).

[^2]:    ${ }^{2}$ The collection, calculation, analysis and dissemination of official statistical information regarding the demographic and socioeconomic characteristics of the population covered and the characteristics of the dwellings.

[^3]:    ${ }^{3}$ An EA is a small geographic unit, into which the country is divided for census and statistical purposes, and for which enumerators are required to undertake the necessary enumeration in the required period.
    ${ }^{4}$ In a few cases, two small EAs were assigned to one enumerator.

[^4]:    ${ }^{5}$ Ministry of Finance, Ministry of Health, Ministry of Education and Youth and Sport, Ministry of Higher Education, Science and Culture, Ministry for Social Solidarity and Inclusiveness, Ministry of Agriculture and Fisheries, Ministry of Tourism, Commerce and Industry, Ministry of Justice, Central Bank of Timor-Leste, University of Timor-Leste, Human Capital Development Fund, Partnership for Human Development, Working Women's Center, Timor-Leste Disability Association, Catholic Church, Protestant Church, UNFPA, UNICEF, UNDP, UN Women, WHO, World Bank, Japan International Cooperation Agency, Korea International Cooperation Agency, Australian Agency for International Development, ChildFund Australia.

[^5]:    ${ }^{6}$ These factors reflect the quality assurance framework that is related to the following census quality dimensions: relevance, accuracy and reliability, timeliness and punctuality, coherence and comparability, sound methodology and appropriate procedures, limited respondent burden, and cost-effectiveness.
    ${ }^{7}$ For example, detailed or sensitive information can better be collected in designated surveys. The 2019 Agricultural Census of Timor-Leste reduced the relevance of including a large agricultural module in the Population and Housing Census.

[^6]:    ${ }^{8}$ The AES is a symmetric-block cipher used by the United States government in software to protect sensitive data. AES-256 encrypts and decrypts data in blocks of 256-bits. This type of key lengths is deemed sufficient to protect classified top-secret information.

[^7]:    ${ }^{9}$ The Degree of urbanisation (DEGURBA) is a classification that indicates the degree of urbanisation of an area.
    ${ }^{10}$ Currently, the government, through the Ministry of State, is in the process of revising the classification of urban and rural areas. A declaration was already issued by the government early in 2023, indicating that it planned to start the process of rural-urban reclassification.

[^8]:    ${ }^{\text {a }}$ Information in this table is based on private and collective households.

[^9]:    ${ }^{\text {a }}$ Information in this figure is based on private and collective households.

[^10]:    ${ }^{11}$ By 2030, end preventable deaths of newborns and children under 5 years of age, with all countries aiming to reduce neonatal mortality to at least as low as 12 per 1,000 live births and under- 5 mortality to at least as low as 25 per 1,000 live births.

[^11]:    12 Life-time migration refers to the net migration between the place of birth and the place of usual residence. Internal lifet-ime migration only includes persons whose place of birth and place of usual residence are in Timor-Leste, i.e. it excludes persons who are born abroad or who live outside the country.

    13 The net internal migration ratio for a municipality is the difference between the number of people born in another municipality and the number of people who moved to another municipality, expressed as a percentage of the population living in the municipality.

[^12]:    ${ }^{14}$ A detailed table for country of birth will be included in the second census report.

[^13]:    ${ }^{15}$ Persons having citizenship of Timor-Leste and another country are included in the number of persons with Timor-Leste as country of citizenship.

[^14]:    ${ }^{16}$ This figure is based on Table 4.2 in chapter 4.

[^15]:    ${ }^{17}$ Persons in employment include those 'at work' (those who worked in a job for at least one hour in the reference week) and employed persons 'not at work', due to temporary absence because of, for instance, illness, vacation, pregnancy.

[^16]:    ${ }^{18}$ A LFPR calculated according to the 2015 census labour market definitions gives an overall figure of 47.4 percent. This is considerably higher mainly due to the inclusion of subsistence farming, fishing and animalproduction in the employed population.

[^17]:    19 The 2022 Timor-Leste Population and Housing Census strictly followed the definition of household specified by the UN Principles and Recommendations for Population and Housing Censuses: the 2020 Round (United Nations, 2017).
